The Washoe County Regional EMS Protocols were last reviewed and approved on 06/13/19 for use beginning 07/01/19.
The Washoe County Regional EMS Protocols are intended to establish guidelines and best practices for regional patient care and treatment. Agencies utilizing these protocols may not be able to procure all medications and equipment due to availability, funding, and Medical Director discretion. All appropriately indicated medications and equipment will be utilized if available. In situations where co-responders may have differing medication or equipment complements, providers should work cooperatively and in the best interest of the patient.

This patient care document has been specifically developed for Washoe County EMS responders. The purpose of this manual is to provide guidance for ALL prehospital care providers. In any such protocol, certain assumptions are made regarding the condition of the patient, expected responses to treatment, and the availability of resources. Since these assumptions will not always be true, the emergency medical technician must use these protocols as a guide, as well as, agency specific Medical Director endorsed medications and procedures.

*NOTHING* contained within these protocols is meant to delay rapid patient transport to a receiving facility. Patient care should be rendered while en-route to the hospital when transport is available.

The majority of these protocols generally reflect a conservative and accepted standard for treatment. The technician in charge at an emergency medical incident is encouraged to use judgment in the application of these protocols. If a treatment plan appears to be insufficient for any reason, medical control consultation is encouraged. The medical control physician directing care in the field retains discretion in ordering specific forms of treatment, even if that treatment is in conflict with these guidelines. Obviously, to proceed with an order directed by medical control requires that both the physician and the provider acknowledge and agree that the patient’s condition and extraordinary care are not addressed elsewhere within these medical protocols, and that the order is in the best interest in the care of the patient. Additionally, the provider must feel capable, based on the instructions given by the medical control physician, of correctly performing the directed care. Whenever such care is provided, it is necessary for the patient care report (PCR) documentation to describe the circumstances which necessitated the deviation, as well as document the physician’s name who gave the order(s), the treatment change and the time of the order.

Occasionally, a situation may arise in which a physician’s order cannot be carried out due to the provider’s sense that the administration of an ordered treatment would endanger the patient, the particular medication is not available, or that a physician's order is outside of protocol or NRS statute. If this occurs, the provider must immediately notify the medical control physician as to the reason the order cannot be carried out, and indicate on the PCR what was ordered, the time and the reason the order could not be administered.

**Per Nevada Administrative Code 450B.180 a “Patient” is:**

Any person who is sick, injured, wounded, or otherwise incapacitated or helpless and who is carried in an ambulance or air ambulance or is cared for by an emergency medical dispatcher, emergency medical responder, emergency medical technician, advanced emergency medical technician, paramedic or registered nurse.

**Pediatric Patient Definition**

- Pediatric treatment protocols are to be used on children who are age 12 and under. If age is unknown and/or there are obvious signs of puberty, the patient may be treated as an adult.

**Commitment to STAR Care**

The following is a checklist you can use to analyze almost any patient care issue you might encounter. Go through the list in order from top to bottom, and ask yourself if your care meets each criterion. If it does, chances are that you can defend your actions in almost any forum.

- **Safe** - Were my actions safe -- for me, for my colleagues, for other professionals and for the public?
- **Team-Based** - Were my actions taken with due regard for the opinions and feelings of my co-workers, including those from other agencies?
- **Attentive to Human Needs** - Did I treat my patient as a person? Did I keep him/her warm? Was I gentle? Did I use his/her name throughout the call? Did I tell him/her what to expect in advance? Did I treat his/her family and/or relatives with similar respect?
- **Respectful** - Did I act toward my patient, my colleagues, the first-responders, the hospital staff and the public with the kind of respect that I would have wanted to receive myself?
STAR Care (Continued)

- **Customer-Accountable** - If I were face-to-face right now with the customers I dealt with on this response, could I look them in the eye and say “I did my very best for you.”
- **Appropriate** - Was my care appropriate—medically, professionally, legally and practically — considering the circumstances I faced?
- **Reasonable** - Did my actions make sense? Would a reasonable colleague of my experience have acted similarly, under the same circumstances?
- **Ethical** - Were my actions fair and honest in every way? Are my answers to these questions?

References

Electrical Axis of the Heart

The electrical axis is the sum total of all electrical currents generated by the ventricular myocardium during depolarization. Analysis of the axis may help to determine the location and extent of cardiac injury, such as ventricular hypertrophy, bundle branch block, or changes in the position of the heart in the chest (from, e.g., pregnancy or ascites). The direction of the QRS complex in leads I and aVF determines the axis quadrant in relation to the heart.

UNIVERSAL TREATMENT PROTOCOLS
Acute Adrenal Crisis

Patient with signs and symptoms of:
- Shock
- Cardiovascular instability
- Hyperkalemic arrhythmias

AND
- Have a documented diagnosis of Congenital Adrenal Hyperplasia or another form of adrenal insufficiency.

- Assess oxygenation and administer O₂ as needed
- Cardiac monitor
- Manage airway
- Determine blood glucose level
- Obtain IV or IO access
- Administer either:
  - HYDROCORTISONE SODIUM SUCCINATE
    - 2 mg/kg IV/IO/IM for children
    - 100 mg IV/IO/IM for adolescents and adults
  - IM route is preferred
- OR
  - METHYLPREDNISOLONE
    - 2 mg/kg IV/IO/IM for pediatrics, max dose 125mg
    - 125 mg IV/IO/IM for adults
Amputation

- Resuscitate and treat other more urgent injuries
- Control bleeding with appropriate measures
  - Tourniquet proximal to injury if other measures ineffective
- Obtain IV access
- Consider Pain Management/Sedation protocol or Pediatric Pain Management/Sedation protocol.

Amputation:

- Rinse wound with sterile saline, place moist sterile dressing over stump and pressure wrap
- Rinse amputated part in sterile saline, wrap in dry pads and place in dry container on ice. Avoid possible cold injury to part. Transport part with patient

Partial Amputation:

- Control bleeding
- Splint in anatomical position and stabilize securely
- Cover with moist saline dressing
- Do not remove foreign bodies
- Save any avulsed tissue
General Patient Assessment

- Review dispatch information while en route
- Determine proper PPE
- Evaluate scene safety
- Determine number of patients
- Consider the need for additional resources

START triage if MCI

Determine the mechanism of injury or nature of illness

Patient assessment/history with vital signs, SpO₂ and pain scale upon contact:
- Airway
- Breathing
- Circulation
- Disability
- Exposure

- Consider cardiac monitor or AED
- Consider 12-lead ECG
- Consider vascular access and administer fluids as needed
  - Adult - fluid bolus 500 mL, reassess, up to 2000 mL max
  - Pediatric - fluid bolus 20 mL/kg may repeat x 1
  - Neonate - fluid bolus 10 mL/kg may repeat x 1

Consider monitoring EtCO₂, SpCO and SpMet

Perform ongoing assessment and refer to appropriate protocols based on findings
Less than lethal munitions are discriminate weapons that are explicitly designed and employed to incapacitate personnel while minimizing fatalities and undesired damage to property and the environment. Unlike weapons that permanently destroy targets through blast, fragmentation, or penetration, less than lethal munitions have relatively reversible effects on personnel.

- Any patient who has encountered less than lethal munitions needs to have a full assessment to identify any injuries or medical conditions which would require treatment and should be transported to the Emergency Department for further evaluation and care, unless the patient has the capacity and competence to refuse care and sign an AMA.
- In any patient, who has been involved in an encounter with law enforcement and who experienced a great deal of physical activity and who has been placed in restraints, the provider should consider the possibility of “In Custody Death.” The recent use of drugs, alcohol, obesity, or medical history may increase the risk for sudden cardiac arrest.
- Assess and treat with appropriate protocol according to findings and patient signs and symptoms.

### Pepper Spray (Oleoresin Capsicum)/ CS Gas (Tear Gas) Exposure Care

- Be aware of cross contamination when treating patients
- Severe complications are possible with the following patients:
  - Elderly
  - Cardiac
  - COPD
  - Asthma
- Flush the affected eye(s) with normal saline.
  - Be careful not to flush into an unaffected eye
- Capsicum exposure can also be neutralized with commercial wipes or spray
- Always wear gloves & eye protection when flushing contaminated patients
- If the patient is experiencing eye pain secondary to pepper spray, apply appropriate ophthalmic anesthetic agent to numb the affected eye(s)

### Taser Dart Care

- Assess the patient for secondary injuries after Taser application
- Energy from a Taser can ignite flammable liquids and gasses
- If the Taser dart has penetrated the eye or other sensitive area such as the face, neck, or groin:
  - Immobilize the dart; cut the wires right above the dart and transport
- To remove the darts in other areas:
  - Pull the skin taut and pull the dart(s) straight out
  - Clean the site around the wound
  - Advise the patient to beware for signs of infection

### Kinetic Impact Munition Care

- The common kinetic impact munitions include bean bag rounds, plastic or wooden projectiles, and rubber sting balls
- All kinetic impact munitions have the potential to cause severe injury/death
- Persons struck by these munitions require a thorough assessment
- Some kinetic munitions contain pepper spray or tear gas- use the same cautions listed for these substances
Obvious sign of death: decapitation, decomposition, dependent lividity, incineration, injuries incompatible with life, rigor mortis, visible brain matter; or DNR/POLST

- **Yes**: Do not start resuscitation, pronounce on scene
- **No**: Begin BLS resuscitation
  - If hypothermia, contact **Medical Control** and follow **Hypothermia/Cold Emergency** protocol

Blunt trauma arrest with > 10 minute ETA to trauma center  
OR  
Penetrating trauma arrest with > 15 minute ETA to trauma center

- **Yes**: Contact **Medical Control** for termination orders
- **No**: Initiate ALS resuscitation:
  - Patients with penetrating trauma, initiate ALS resuscitation en route, expedite transport
  - Call for termination orders if:
    - ALS treatment is unsuccessful
    - In intubated patients, EtCO₂ of < 10 mmHg after 20 minutes of CPR

When death has been established:
- If possibility of criminal implications, try to leave patient in position found.
- Secure the body and surrounding area until law enforcement arrives.
- Obvious death as described above does NOT require a cardiac monitor strip.
- All other cases of pronounced death MUST have a cardiac monitor strip. Document time of death, name of physician who pronounced death, and the names of law enforcement personnel who take custody of patient if coroner not available.

**Pearls:**
- The paramedic may cease resuscitation if initiated prior to arrival and patient shows obvious and accepted signs of death or if resuscitation is initiated prior to arrival and DNR or POLST is presented.
- Arrests resulting from electrical injury; treatments should be early, aggressive and persistent. Resuscitation efforts have high success rates even when resuscitation attempts are prolonged.
**Spinal Motion Restriction**

**Conduct a focused spinal exam:**
- Can the patient focus on the exam or are they in severe distress from other injuries or emotional stressors? (distracting injury)
- Assess distal CMS/bi-lateral grips/push-pull.
- Palpate the entire spine on the boney processes one at a time from C1 to L5. Patient should not have focal midline tenderness to palpation or obvious deformity.
- Ask the patient to rotate their head 45 degrees from side to side without assistance, which should be pain free.

**Focused spinal assessment reveals:**
- Unresponsive
- Inability/barrier to perform focused spinal exam
- Gross motor or sensory deficits from blunt trauma

**Full Spinal Motion Restriction**
Application of a cervical collar and placement of patient on padded backboard or equivalent with head and body secured with straps and tape.

**Focused Spinal Motion Restriction**
Application of a cervical collar and placement of patient in a position of comfort on gurney with normal seat belt straps applied.

**If no to all of the above, focused spinal motion restriction not necessary**

**Peals:**
- Consider modified restriction in any patient with arthritis, cancer, dialysis, kyphosis or other underlying spinal or bone disease or who may have increased risk of spinal compromise.
- Any patient may be motion restricted based on EMS provider discretion.
Patient with trauma means a person who has sustained injury and meets the triage criteria used to evaluate the condition of the patient (NAC450B.798).

**Measure vital signs and consciousness:**
- Glasgow Coma Scale $\leq 13$, Systolic BP $< 90$ mmHg, and respiratory rate $< 10$ or $> 29$ per minute

**Assess anatomy of injury:**
- All penetrating injuries to head, neck, torso, and extremities proximal to elbow or knee
- Chest wall instability or deformity (e.g. flail chest)
- Two or more proximal long-bone fractures
- Crushed, degloved, mangled, or pulseless extremity
- Amputation proximal to wrist or ankle
- Pelvic fractures
- Open or depressed skull fracture
- Paralysis

**Assess mechanism of injury and evidence of high energy impact:**
- Falls
  - Adults: $> 20$ feet (one story is equal to $10$ feet)
  - Children: $> 10$ feet or two to three times the height of the child
- High-risk auto crash
  - Intrusion, including roof: $\geq 12$ inches occupant side; $> 18$ inches any side
  - Ejection (partial or complete) from automobile
  - Death in same passenger compartment
  - Vehicle forces consistent with a high risk of injury
- Auto vs. pedestrian/bicyclist thrown, run over, or with significant impact ($> 20$ mph)
- Motorcycle crash $> 20$ mph

Consider contacting **Medical Control** for direction:

**Older Adults**
- Risk of injury/death increases after age 55 years
- SBP $< 110$ may represent shock after age 65
- Low impact mechanisms (e.g. ground level falls) may result in severe injury

**Children**
- Should be triaged preferentially to pediatric capable trauma centers

**Anticoagulants and bleeding disorders**
- Patients with head injury are at high risk for rapid deterioration

**Burns**
- Without other trauma mechanism: triage to burn facility
- With trauma mechanism: triage to trauma center

**Pregnancy > 20 weeks**

**Transport to a trauma center**
ADULT TREATMENT PROTOCOLS
THIS PAGE IS INTENTIONALLY LEFT BLANK
Acute Coronary Syndrome (Suspected)

12-lead ECG

- Vascular Access
- Oxygen - Keep SpO₂ > 94%
- ASPIRIN – 324 mg PO

NITROGLYCERIN:
- If SBP > 100, 0.4 mg SL; may repeat q 5 min until pain free
- Consider 1 inch of NITROGLYCERIN PASTE if ETA to hospital > 15 minutes

Consider Pain Management/Sedation with FENTANYL and/or MORPHINE

Refer to Nausea/Vomiting protocol as needed

If SBP > 140 & HR > 100 in a STEMI patient; contact Medical Control for possible administration of METOPROLOL 5 mg slow IV

Pearls:
- NITROGLYCERIN and MORPHINE are contraindicated in patients with RVI, consider fluid bolus.
- NITROGLYCERIN is contraindicated in patients currently taking phosphodiesterase inhibitors.
- 12-lead ECG should be obtained as soon as reasonably possible.
- Diabetic, geriatric and female patients often have an atypical presentation.
- Perform a 12-lead ECG on all patients 35 years of age or older experiencing vague jaw/chest/abdominal discomfort.
- Consider 15-lead ECG or alternate lead placement for inferior MI, suspected ACS with normal 12-lead, or ST depression in the precordial leads. For a 15-lead, use leads V4 for V4R, V5 for V8, and V6 for V9. Immediately relabel the 15-lead print out to avoid confusion.
Airway Obstruction

Is the patient conscious or unconscious?

Conscious
- Ask patient to speak or cough to establish level of obstruction
- If unable to speak, apply abdominal thrusts until foreign body is expelled or the patient becomes unconscious
- Suction as needed
- Continually monitor SpO2

Unconscious
- Place patient in supine position
- Open the airway with the appropriate method and check for breathing
- Perform finger sweep if object is visible – remove dentures if applicable
  **DO NOT PERFORM BLIND FINGER SWEEPS**
- Start CPR with chest compressions – do not perform a pulse check
- After one cycle of CPR (30:2), open the airway
- Attempt to visualize the obstruction – ventilate with 2 breaths
- If the obstruction is not resolved, continue with cycles of chest compressions and ventilations
- Attempt to visualize the obstruction with a laryngoscope and remove it with the Magill forceps – take care not to cause further obstruction
- If unsuccessful, a Surgical Cricothyrotomy may be necessary

Pearls:
- If the patient presents with trismus and noisy respirations, insert a NPA and attempt to assist ventilations with a BVM.
- Avoid hyperventilation.
- Maintain EtCO2 at 35-45.
Anaphylaxis is defined as an acute onset of an illness (over minutes to several hours) involving the skin, mucosal tissue, or both (e.g., generalized hives, pruritus or flushing, swollen lips-tongue-uvula) and respiratory compromise (e.g., dyspnea, wheezing- bronchospasm, stridor, reduced peak expiratory flow, hypoxemia) and/or reduced BP or associated symptoms of end-organ dysfunction (e.g., hypotonia [collapse] syncope, incontinence).

### Allergy/Anaphylaxis

**MILD** - Swelling, itching, redness, hives
- DIPHENHYDRAMINE 25-50 mg IM/IV/PO, if established

**MODERATE** - Mild plus wheezing and difficulty swallowing, mild hypotension:
- Obtain IV access; NS fluid bolus
- DIPHENHYDRAMINE 25-50 mg slow IV push
- ALBUTEROL unit dose HHN, as needed
- Consider EPINEPHRINE, 0.3 mg 1:1,000 IM (if not contraindicated) - with rapid progression of signs/symptoms or history of severe allergic reaction
- If reaction is worsening despite treatment, move to **SEVERE**

**SEVERE** - Impending respiratory failure, severe hypotension
- Secure Airway
- EPINEPHRINE 0.3 mg (0.3 mL) 1:1,000 IM (if not contraindicated)
- DIPHENHYDRAMINE 25-50 mg slow IV push
- METHYLPREDNISOLONE 125 mg IV/IO
- EPINEPHRINE 0.1 mg (1 mL) 1:10,000 IV repeated up to three times followed by 100 mL NS
- Treat signs and symptoms of shock as necessary

### Dystonia

- Obtain IV access
- DIPHENHYDRAMINE 25-50 mg IV/IM

### Instructions

- Assess oxygenation and administer oxygen as needed
- Assess severity of allergic reaction
Patient restraint – when patient is a threat to themselves, bystanders or EMS personnel

- Patients may be restrained with soft restraints
- Restraining opposing muscle groups (swimmers position) is most effective; never restrain in prone/hog-tied position
- Assess distal CMS after restraint, every 10 minutes
- Maintain and monitor the oxygenation
- Obtain vascular access as needed
- Apply cardiac monitor as needed – **Required with chemical restraint**
- Document reasons for restraint
- Incarcerated person may be restrained at the discretion of Law Enforcement
  - For handcuffed patients, request Law Enforcement accompaniment

Consider use of a chemical restraint:

- HALOPERIDOL 5-10 mg IV/IM q 5-10 min; max 15 mg
- MIDAZOLAM 2-5 mg slow IV/IO/IM/IN q 5 mins titrated to effect; Total dose 10 mg
- KETAMINE 4 mg/kg IM OR 1-2 mg/kg IV

Pearls:

- KETAMINE is contraindicated for patients with a history of schizophrenia.
- Use caution when using KETAMINE for suspected alcohol intoxication.
- If using KETAMINE, consider MIDAZOLAM to prevent reemergence phenomenon.
- Hostile, angry or unwilling patients who are competent may refuse service.
- Ensure the patient is searched for weapons prior to transport.
Some patients may bypass the nearest trauma center and be directly transferred to a burn center based on the destination protocol.

**Chemical Burns/Hazmat Contamination**
- Protect rescuer from contamination
- Remove all clothing and solid chemical which might provide continuing contamination
- Decontaminate patient using running water for 15 minutes if patient is stable
- Assess and treat associated injuries and evaluate for systemic symptoms
- Wrap burned area in clean dry cloth
- Keep patient warm after decontamination
- Contact hospital as soon as possible with type of chemical contamination for consideration of additional decontamination prior to entry into ED

**Electrical Burn/Lightning**
- Protect rescuers from live electric wires
- Separate victim from electrical source when safe for rescuers
- Initiate CPR as needed
  - For victims in cardiac arrest, treatment should be early, aggressive, and persistent
  - Victims with respiratory arrest may require only ventilation and oxygenation to avoid secondary hypoxic cardiac arrest
  - Resuscitation attempts may have high success rates and efforts may be effective even when the interval before the resuscitation attempt is prolonged
- Place patient on cardiac monitor
- Obtain vascular access
- Treat any thermal burns as outlined above
- Assess for other injuries

- Consider Pain Management/Sedation protocol
- Treat dysrhythmias per protocol
Some patients may bypass the nearest trauma center and be directly transferred to a burn center based on the destination protocol.

### Thermal Burns

- Remove clothing which is smoldering and non-adherent to the patient
- Assess oxygenation and administer Oxygen as needed
- Assess and treat associated trauma/smoke inhalation
- Remove rings, bracelets and other constricting objects
- Determine burn body surface area (BSA)
  - If < 10% body surface area burned, use moist saline dressing for patient comfort
  - If burn is moderate to severe (> 10% BSA), cover with clean, dry dressings
- Obtain vascular access

Administer IV fluids as follows:
- If transport time is greater than 15 minutes administer 500 mL per hour
- If transport time is less than 15 minutes, run IV at wide open rate

---

### Pearls:

- Parkland Burn Formula – 4 mL NS x BSA (%) x body weight (kg) = total fluids.
  - Administer 50% of total fluids in first 8 hours from time of injury
  - Administer 50% of total fluids over next 16 hours
- BSA is calculated for partial thickness and full thickness burns.
Cardiac Arrest

- Unconscious and unresponsive
- Pulseless
- Does not meet Resuscitation/Prehospital Death Determination protocol

- Begin CPR- pulse check/rhythm interpretation every 2 minutes
  - Continue CPR following all pulse checks as indicated by patient condition
- Place patient on cardiac monitor or AED
  - Utilize MFE pads and CPR assist devices
- Manage airway as indicated by patient condition
- Consider reversible causes

**VF, pVT, TdP**

- Defibrillate
- 2 min CPR prior to medication administration
- Obtain vascular access
- Intubation or insertion of supraglottic airway device
- Utilize EtCO₂ as soon as possible

** VF, pVT**

AMIODARONE 300 mg IV/IO, may repeat at 150 mg in 3-5 min, for sustained VF, pVT

OR

LIDOCAINE 1.0-1.5 mg/kg IV/IO, followed by 0.5-0.75 mg/kg IV/IO every 5 min to 3 mg/kg max

If the patient converts to a perfusing rhythm after administration of LIDOCAINE, start LIDOCAINE infusion at 2-4 mg/min IV/IO

**If TdP**

MAGNESIUM SULFATE 2 gm IV/IO over 5 min

**Asystole/PEA**

- Obtain vascular access
- Intubation or insertion of supraglottic airway device
- Utilize EtCO₂ as soon as possible

**EPINEPHRINE 1.0 mg IV/IO every 3-5 min**

If TdP

MAGNESIUM SULFATE 2 gm IV/IO over 5 min

**Pearls:**

- Joule settings for defibrillation are 120J/150J/200J.
- EPINEPHRINE dose via ETT is 2.5 mg 1:1,000, diluted in 10 mL NS.
- LIDOCAINE dose via ETT is 3 mg/kg x 2.
- Routine use of LIDOCAINE is not recommended.
- Prophylactic use of post conversion AMIODARONE is not recommended.
- For sustained TdP post MAGNESIUM SULFATE administration, continue with AMIODARONE as indicated.
- Use caution when administering two or more ventricular antidysrhythmics, as it may have a proarrhythmic effect.
Cardiac - Bradycardia

- Oxygen therapy to keep SpO$_2$ ≥ 94%
- Obtain IV access
- Obtain 12 lead ECG

Bradycardia causing the following:
- Hypoperfusion
- Signs of shock

For 2$^{nd}$ degree type II and 3$^{rd}$ degree blocks go directly to TCP

- ATROPINE 0.5 mg IVP; may repeat q 3-5 min; max 3 mg

- Transcutaneous Pacing
- Consider Pain Management/Sedation protocol for conscious patients

If TCP is ineffective, consider:
- DOPAMINE; 2-10 mcg/kg/min IV
  OR
- EPINEPHRINE; 2-10 mcg/min IV/IO infusion, titrate to SBP 90 mmHg or MAP of 65

Pearls:
- **Mean Arterial Pressure (MAP):** MAP = ((DBP x 2) + SBP)/ 3.
- ATROPINE administration should not delay TCP in patients with poor perfusion.
- ATROPINE is contraindicated in the presence of acute coronary ischemia or MI.
- Consider calling **Medical Control** for GLUCAGON for patients with suspected beta blocker or calcium channel blocker overdose.
- Consider calling **Medical Control** for CALCIUM CHLORIDE for patients with suspected calcium channel blocker overdose.
- Repeat 12-lead ECG for evolving STEMI.
- Identifying signs and symptoms of poor perfusion caused by bradycardia are paramount.
- Signs and symptoms of bradycardia may be mild and are typically < 50 BPM.
- Do not delay pacing while waiting for IV access.
- Hypoxemia is a common cause of bradycardia; be sure to oxygenate the patient and provide ventilation support as needed.
Cardiac - Narrow Complex Tachycardia w/Pulses

- **Rate ≥ 150**
- **Vascular Access**
- **Consider 12-Lead ECG**

### SVT (Regular)
- Attempt vagal maneuvers while obtaining proximal IV access
- **ADENOSINE** 6 mg rapid IVP followed by 20 mL NS flush
- **ADENOSINE** 12 mg rapid IVP followed by 20 mL NS flush (May repeat 1 additional time)

### Hypotension, altered mental status, signs of shock, chest pain, heart failure
- **Supportive care**
- No

### Atrial Fibrillation or Atrial Flutter
- **Contact Medical Control** for orders
- **DILTIAZEM** 15-20 mg IV/IO over 5 min; after 15 minutes, if not resolved:
  - **DILTIAZEM** 20-25 mg over 5 min

### Consider Pain Management/Sedation protocol

### SYNCHRONIZED CARDIOVERSION
- Zoll: 70/120/150/200 Joules

### Contact Medical Control for further orders

---

**Pearls:**
- Should consider DILTIAZEM maintenance infusion 5-15 mg/hr titrated to heart rate when contacting Medical Control.
- Determining onset of atrial fibrillation or atrial flutter guides treatment options when contacting Medical Control.
- May go directly to cardioversion at any time if severely symptomatic or patient deteriorating.
- Manage airway as indicated
- Maintain SpO₂ between 94-99%
- Maintain EtCO₂ at approx. 35-40 mmHg; DO NOT HYPERVENTILATE

12-lead ECG

- To maintain MAP of > 65 mmHg, administer 500 mL fluid bolus if lung sounds are clear. Repeat and reassess to max 2000 mL
- Hypotension refractory to fluid boluses
  - LEVOPHED 2-20 mcg/min IV/IO
  - EPINEPHRINE 2-10 mcg/min IV/IO; titrate to MAP > 65 mmHg
  - DOPAMINE 5-10 mcg/kg/min IV; titrate to MAP > 65 mmHg

Is patient unconscious?

Yes

See Hypothermia/Post ROSC protocol

No

- Cooling not indicated
- Provide supportive care

Pearls:
- **Mean Arterial Pressure (MAP):** MAP = ((DBP x 2) + SBP)/ 3.
- Do not cool post traumatic arrest or pregnant patients.
- Initial EtCO₂ may be elevated immediately post resuscitation but will normalize.
- If ROSC in previously hypothermic patient (core temp < 93°F or 34°C), refer to Hypothermia/Cold Emergency protocol.
- Use caution in treating immediate post arrest arrhythmias, as they may resolve spontaneously.
- All post arrest patients, excluding trauma, should be transported to nearest PCI capable facility.
Cardiac - Wide Complex Tachycardia with Pulses

Vascular Access
12-Lead ECG

- Sustained > 30 seconds
  - AMIODARONE 150 mg IV/IO over 10 min
  - SYNCHRONIZED CARDIOVERSION
    - Zoll: 70/120/150/200 Joules
    - Consider Pain Management/Sedation protocol

- Unsustained < 30 seconds
  - 12-Lead ECG shows QTc > 450 ms in baseline QRS complexes
    - LIDOCAINE 1.0-1.5 mg/kg IV/IO; slow push followed by infusion at 2-4 mg/min
    - AMIODARONE 150 mg IV/IO over 10 min
    - If rhythm persists, call for additional orders

Pearls:
- If patient is hemodynamically unstable, consider Cardioversion as primary treatment.
- For Torsades de Pointes, 2g MAGNESIUM SULFATE diluted in NS IV/IO, over 5 min.
- Consider ADENOSINE if regular, monomorphic, and undifferentiated.
- If cardioversion is successful prior to AMIODARONE administration with continued ventricular ectopy, consider AMIODARONE 150 mg IV/IO over 10 minutes.
- If suspected SVT with aberrancy, see Narrow Complex Tachycardia protocol.
- It is recommended not to mix antidyssrhythmic medications during the course of patient treatment.
- Unsustained WCT can be considered frequent runs or salvos of WCT.
**Normal Presentation**
- Puncture amniotic sac, if not already broken
- Deliver and support the head
- Suction mouth, then nose; if meconium present, repeat several times
- Deliver upper shoulder, then lower shoulder
- Deliver remainder of the baby
- Clamp and cut umbilical cord
- If multiple births, repeat steps
- Deliver placenta

**Breech Presentation**
- Position patient on elbows and knees with hips elevated
- Support body of baby during delivery of head
- If head does not deliver but body is out, insert gloved hand into vagina and form a ‘V’ to protect baby’s airway from vaginal wall

**Cord Presentation**
- Position patient in position of comfort with pelvis elevated
- Wrap cord and keep it moist
- Insert gloved hand to lift baby off cord; obtain and document cord pulse

**Limb Presentation**
- Position patient in position of comfort with pelvis elevated

**Nuchal Presentation**
- Use palm of one hand to push against the motion of the infant and use the fingers of the other hand to unloop the cord from around the neck
- If you are unable to slip the cord around the head, clamp the cord in two places and gently cut the cord between the clamps
- Continue delivery

**Uncontrolled Postpartum Hemorrhage**
- Administer 500 mL NS; repeat as needed not to exceed 2000 mL
- Fundal massage
- OXYTOCIN IV infusion 20 units in 1000 mL NS; Give 10 units (500 mL) over 10-20 minutes, then maintenance infusion 2.5 units (125 mL) per hour

**Pearls:**
- Document all times (delivery, contraction duration and frequency).
- Some bleeding is normal; copious amounts of blood or free bleeding is abnormal.
- Record APGAR at one and five minutes after birth as a measure of overall cardiopulmonary and neurologic function.
A crush injury is when a patient or part of the patient’s body is entrapped or compressed for a time greater than 30 minutes. It may also be applied to a patient who, due to fall or overdose, has had no movement in an extremity for greater than 4 hours.

- Administer fluid bolus
  - 20 mL/kg for adults, followed by maintenance infusion of 500-1500 mL/hour
  - It is recommended a minimum of 500-1000 mL be given prior to releasing the patient or extremity from the compression
- SODIUM BICARBONATE 1 mEq/kg in 1000 mL of NS wide open (consider this part of fluid bolus)
- If Hyperkalemia suspected, see Hyperkalemia protocol
- Extremity management
  - Do not use ice packs or elevation of extremities

- Consider Pain Management/Sedation protocol as needed
- FENTANYL is recommended over MORPHINE due to vasodilatory effects of MORPHINE SULFATE

Pearls:
- Compartment syndrome is usually due to a crush injury and because of prolonged compression or pressure the interstitial pressure within a closed anatomical space exceeds the perfusion pressure. It occurs most commonly in the pelvis and lower extremities, but may also occur in the upper extremities or trunk. Compartment syndrome may result in ischemic swelling, muscle infarction, nerve injury and permanent loss of extremity function.
Hyperglycemia/Hypoglycemia

- Establish baseline level of consciousness
- Manage the airway and breathing as indicated by the patient’s condition
- Consider possible reversible causes prior to placement of an advanced airway
- Consider cardiac monitor and 12-Lead ECG

If BGL is < 60 mg/dl:
- Consider ORAL GLUCOSE if the patient is alert/able to protect their own airway
- Establish IV access as applicable
- 12.5-25 gm Dextrose D50% IV/IO, reassess/repeat as needed
  AND/OR
- 125 mL Dextrose D10% IV/IO, reassess/repeat as needed
- Titrate to achieve blood glucose of > 60 mg/dl and/or level of consciousness
- Consider THIAMINE 100 mg slow IV/IM for chronic alcoholism/malnutrition
- If unable to obtain an IV, administer GLUCAGON 1 mg IM
- If GLUCAGON is ineffective, establish an IO
  o Administer 125 mL Dextrose D10% IO, reassess/repeat as needed
  OR
  o Administer 12.5-25 gm Dextrose D50% IO, reassess/repeat as needed
- Reassess BGL after each intervention as necessary

If BGL is > 250 mg/dl:
- Consider Fluid bolus up to 20 mL/kg, reassess
- Consider monitoring EtCO₂

Pearls:
- Consider DKA or Hyperglycemic Hyperosmolar Syndrome on the patient that is a known person with diabetes and had a recent illness or injury.
Hyperkalemia (Suspected)

- 12-Lead ECG

Symptomatic with:
- Peaked T waves
- Widened QRS
- Ectopy

CALCIUM CHLORIDE 5-10 mL 10% slow IV/IO over 5 min
ALBUTEROL 2.5 mg in 3.0 mL continuous HHN
SODIUM BICARBONATE 1.0 mEq/kg infusion over 5 min

Pearls:
- CALCIUM CHLORIDE is contraindicated in patients with suspected digitalis toxicity.
- Patients predisposed to hyperkalemia may include Crush Injury, chronic renal failure, and TCA overdoses.
- Hyperkalemia is defined as potassium level higher than 5.5 mmol/l.
- Potassium of 5.5 - < 6.0 mEq/L – Tall tented T waves.
- Potassium of 6.0 - < 6.5 mEq/L – Increasing PR and QT intervals.
- Potassium of 6.5 - < 7.0 mEq/L – Flattening of P waves and ST segments.
- Potassium of 7.0 - < 7.5 mEq/L – Widened QRS complexes.
- Potassium of 7.5 - < 8.0 mEq/L – Deepening S waves and merging of S and T waves.
- Potassium of 8.0 - < 10.0 mEq/L – Sinewave shaped complexes and idioventricular rhythm.
- Potassium of ≥ 10 mEq/L - PEA often sine wave in appearance, VF, VT and Asystole.
**Hyperthermia/Heat Emergency**

**Heat Exhaustion**
- Body temperature up to 104°F/40°C
- Minor CNS changes, weakness, dizziness, fainting
- Nausea, headache, dilated pupils, no appetite
- Skin clammy, pale and moist
- Muscle cramps/pain

**Heat Stroke**
- Body temperature 104°F/40°C or greater
- Altered mental status or loss of consciousness
- Convulsions, seizures
- Tachycardia, hypotension
- Skin (hot, red, dry)
- Severe vomiting or diarrhea

- Remove patient from hot environment and remove clothing
- Begin active cooling of patient with appropriate measures
- Consider cardiac monitor and attempt to obtain body temperature
- Consider vascular access

- Treat signs and symptoms of shock as necessary
- Treat seizures per the *Seizure* protocol

**Pearls:**
- Heat exhaustion can rapidly progress to heat stroke if untreated.
- Heat stroke requires very aggressive cooling.
- Active cooling includes application of cold packs (not directly on skin), fanning, air conditioner or air movement.
- Intense shivering may occur as patient is cooled, discontinue aggressive cooling methods.
- Sweating generally disappears as body temperatures rise over 104°F/40°C.
- Wet sheets without good airflow may increase body temperature.
- Patients predisposed to heat emergencies include:
  - Elderly or pediatric
  - Alcohol or drug use
  - Antidepressant, antipsychotics and antiepileptic medications
  - Diuretics, beta blockers or antihistamines
**Hypothermia/Cold Emergency**

**Localize Cold Injury**
- Monitor and reassess
- General wound care
- DO NOT rub skin to warm
- DO NOT allow refreezing

**Systemic Hypothermia**
- Monitor temperature
- Maintain supine position
- Avoid rough movement and excess activity
- Active warming measures
- Vascular access
- Cardiac monitor
- Consider warm NS bolus 500 mL IV/IO; repeat to effect SBP > 90 max 2L
- Monitor and reassess

**Transport all severely hypothermic patients regardless of response to treatments. Follow appropriate protocols for other treatment/transport decisions.**

### Pearls:
- Extremes of age are more prone to cold emergencies.
- If temperature is unknown, treat the patient based on suspected temperature.
- For the severely hypothermic patient, perform procedures gently and monitor cardiac rhythm closely.
- Active warming includes hot packs that can be used on the armpit and groin; care should be taken not to place the packs directly on the skin.
- If available, core temperature is preferred.
Patients must meet all the following criteria to be eligible for this protocol:

- Have sustained return of circulation post non-traumatic cardiac arrest
- Temperature > 93°F (34°C)
- No purposeful response to voice or pain
- Blood glucose level > 60 mg/dl
- Sustained capnography monitoring in place

The following patients are NOT eligible for this protocol:

- Pregnant patients
- Traumatic or hemorrhagic cardiac arrest patients
- ROSC in previously hypothermic patient

- Ensure continuous monitoring of SpO₂ (94%-99%), EtCO₂ waveform, and ECG
- Monitor temperature
- Maintain EtCO₂ 35-40 mmHg
- Expose patient and place cold packs in axilla and groin
- Assess neurological status
- Ensure vitals are appropriate and follow respective protocol
- Avoid and immediately correct hypotension (SBP less than 90 mmHg, Mean Arterial Pressure less than 65 mmHg) during post-cardiac arrest care
- Search for and treat differential causes of arrest
- If cooling causes shivering: MIDAZOLAM 2-5 mg IV/IO; titrate to effect

If ROSC in previously hypothermic patient (core temperature < 93°F/34°C) use Hypothermia/Cold Emergency protocol
Pearls:

- Pharmacological agents are used to assist the provider in performing intubation in patients with high intubation difficulty due to excessive gag reflex. In these instances, protecting the airway is a potentially life-saving maneuver. These patients may include: Isolated Head Trauma, CVA/Stroke, Multisystem Trauma, Overdose, Status Epilepticus, Acute Pulmonary Edema, Respiratory Failure, Severe Burns, or based on anticipated clinical course.
- This should only be used when other airway control methods are ineffective or contraindicated.
- If using KETAMINE, consider MIDAZOLAM to prevent reemergence phenomenon.
- Reserve ETOMIDATE for non-septic, non-pediatric patients, and/or for those with suspected head injury.

Pre-oxygenate patient
Prepare equipment
Cardiac monitor

If needed, for analgesia or attenuation of increased ICP:

- FENTANYL 1-3 mcg/kg IV/IO

Sedation and Induction:

- KETAMINE 1-3 mg/kg IV/IO
  - OR
- MIDAZOLAM 2-10 mg IV/IO
  - OR
- ETOMIDATE 0.3 mg/kg IV/IO, max total dose 0.6 mg/kg

As patient jaw relaxes, proceed with intubation
Consider cricoid pressure (release if vomiting occurs)

If inadequate relaxation is present:

- If patient is not fully dissociated after KETAMINE, may repeat KETAMINE dose
- If KETAMINE was used and patient is fully dissociated, proceed to MIDAZOLAM 2-5 mg IV/IO
- MIDAZOLAM dose may be repeated at 2-5 mg IV/IO

Indications:

- To establish an emergency airway for patients who cannot provide or protect their own airway or maintain adequate gas exchange.

Contraindications:

- Upper Airway Obstruction
- Tracheal obstruction (foreign body, tumor)
- Suspected pharyngeal infection (epiglottitis, peritonsilar, or retropharyngeal abscess)
Consider Cardiac Monitor

ONDANSETRON
- 4 mg IV/IO/IM/PO may repeat x 1 in 20 min

Second choice:

PROMETHAZINE
- 12.5 mg IV/deep IM may repeat x 1 in 15 min
- Geriatrics - 6.25mg IV/deep IM x 1 no repeat

Pearls:
- Consider cardiac origin and perform a 12-Lead ECG.
- Use antiemetics with caution in patients with a known history of prolonged QT interval. In general, prolonged QT is defined as a QTc > 450 ms.
Overdose/Poisoning

**Carbon monoxide (CO)**
- Place patient on CO monitor, do not rely on pulse oximeter readings
- If patient’s SpCO is:
  - 0 – 5 % - Considered normal for non-smokers. When > 3% with symptoms, consider high flow oxygen and recommend transport. If asymptomatic, no further medical evaluation necessary of SpCO. Counsel patients on signs and symptoms to watch for, offer transport to ED, if refused, complete AMA.
  - 5 – 10 % - Considered normal for smokers, abnormal for non-smokers. If symptoms are present, consider high flow oxygen and recommend transport to ED.
  - 10 – 15 % - Abnormal in any patient. Assess for symptoms, consider high flow oxygen and recommend transport to ED.
  - > 15 % - Significantly abnormal in any patient. Administer high flow oxygen and recommend transport to ED.
  - > 30 % - Consider transport/referral to hyperbaric facility (consider referral to hyperbaric facility if > 25% for patients with ALOC or pregnant).
- If patient has altered LOC, neurological impairment, or > 25% SpCO, treat with 100% O₂ and transport to nearest appropriate facility
- Continue supportive therapies as needed

**Opiates**
- Titrate NALOXONE to restore adequate respirations
  - 0.5 - 2 mg IV/IO/IM/IN may repeat to max total dose of 10 mg

**Tricyclic Anti-Depressants**
For patients with any of the following:
- Dysrhythmias or QRS of ≥ 120 ms
- Hypotension
- Seizure
- Cardiac Arrest
- Administer SODIUM BICARBONATE 1.0 mEq/kg IV immediately call for orders for additional dose
- If patient is intubated, ventilate patient to maintain EtCO₂ level of 28-30 mmHg

**Organophosphate Poisoning (Insecticide)**
- ATROPINE 1-2 mg every 3-5 minutes until cessation of secretions

**Agents:**
- ACETAMINOPHEN: Initially normal or N/V. Tachypnea and AMS may occur later. Renal dysfunction, liver failure and/or cerebral edema may manifest.
- Beta blocker overdose: call for possible administration of GLUCAGON.
- Calcium channel blocker: call for possible administration of CALCIUM CHLORIDE and/or GLUCAGON.
- Depressants: Decreased HR, BP, temp and RR.
- Anticholinergic: Increased HR, increased temperature, dilated pupils and AMS changes.
- Insecticides: May include S/S of organophosphate poisoning.
- Solvents: N/V, cough, AMS.
- Stimulants: Increased HR, BP, temperature, dilated pupils, seizures, and possible violence.
- TCA: Decreased mental status, dysrhythmias, seizures, hypotension, coma, death.
Overdose/Poisoning

Pearls:
- Powdered HYDROXOCOBALAMIN will be reconstituted with 200 cc 0.9% NS or lactated ringers. Repeatedly invert for 60 seconds PRIOR TO administration. Do Not Shake.
- CALCIUM CHLORIDE is contraindicated in patients with suspected digitalis toxicity.
- If patient is suspected to have narcotic overdose/hypoglycemia, administer NARCAN/GLUCOSE prior to BIAD device/intubation.
- Consider a second line if possible for administration and avoidance of possible medication incompatibilities.
- For suspected ingestion, consider NG tube placement.
- Cyanide toxicity should be suspected for any patient being treated for Carbon Monoxide toxicity from smoke inhalation. Conscious patients with symptoms will require Medical Control contact prior to administration.
- Overdose or toxin patients with significant ingestion/exposure should be closely monitored and aggressively treated. Do not hesitate to contact Medical Control if needed.
- In the case of cyanide poisoning, altered mental status may be profound. Profound altered mental status can be defined as a deficit that includes disorientation, bewilderment and difficulty following commands.

Cyanide Exposure
For known cyanide poisoning in the absence of exposure to smoke, refer to the cyanide antidote parameters contained within the Smoke Inhalation protocol.

Poison Control - (800) 222-1222 OR (775) 982-4129
Assess and document patient’s condition and vital signs before and after treatment (at minimum every 15 minutes). Pain should be assessed using a combination of physiologic indicators, including but not limited to, 1-10 pain scale and Bloomsbury Sedation Scale.

- Keep SpO₂ > 94%
- Vascular Access
- Consider Cardiac Monitor

**Comfort measures:**
- Patient positioning
- Splinting
- Ice

**Sedation**
- Cardiac Monitor
- MIDAZOLAM 0.5-5 mg IV/IO/IM/IN may repeat as needed
- ETomidate 0.15 mg/kg IV may repeat once if inadequate sedation
- KETAMINE
  - 0.3 mg/kg IV/IO/IM/IN max single dose 30 mg, may repeat q 10 min as needed
  - 1-2 mg/kg IV/IO may repeat q 5-10 min as needed
  - 4 mg/kg IM may repeat q 10 min as needed

**Bloomsbury Sedation Scale:**
- 3 = agitated/restless
- 2 = awake/comfortable
- 1 = awake/calm
- 0 = roused by voice, remains calm
- -1 = roused by movement/stimulation
- -2 = roused by painful stimulation
- -3 = cannot arouse

**Pain Management**
- IBUPROFEN 600 mg PO and/or ACETAMINOPHEN 1000 mg PO
- NITROUS OXIDE as long as patient is able to follow directions
- FENTANYL 1-3 mcg/kg IV/IO/IN max single dose 100 mcg, may repeat q 5 min as needed
- MORPHINE SULFATE 2-5 mg IV/IO may repeat q 10 as needed
- KETAMINE
  - 0.3 mg/kg IV/IO/IM/IN max single dose 30 mg, may repeat q 10 min as needed

**Pearls:**
- Ophthalmic anesthetics may be used for ocular injuries, 1-2 drops, as needed.
- Consider prophylactic ONDANSETRON use when administering pain medication.
- Pain severity (1-10) is a vital sign to be recorded before and after medication administration and patient hand off.
- Monitor BP and respirations closely as sedative and pain control agents may cause hypotension and/or respiratory depression.
- When administering pain medications to patients with a higher potential for adverse reaction (elderly, intoxicated, opiates or depressants already on board, etc) use caution and consider the need for a lower starting dose to achieve the desired effect.
- Exercise care when administering opiates and benzodiazepines; this combination results in deeper sedation with significant risk of respiratory compromise.
- Burn patients may require more aggressive dosing.
Pulmonary Edema

Pulmonary Edema

- CPAP
- PEEP 5-15 cm H₂O

If HR between 60-120 & SBP < 90 mmHg:

- Refer to Shock-Cardiogenic protocol

If SBP ≥ 100:

- NITROGLYCERIN
  - 0.4 mg SL if SBP > 100, q 5 min
  - 0.8 mg SL if SBP ≥ 160, q 5 min
  - 1.6 mg SL if DBP > 100, q 5 min
  - 1 inch NTG paste if SBP > 100

If CPAP & PEEP 5-15 cm H₂O:

- FUROSEMIDE, if available: 40 mg IV or double home dose up to 80 mg IV

Pearls:
- Avoid administering NITROGLYCERIN to any patient who is currently using phosphodiesterase inhibitors.
- Consider NITROGLYCERIN PASTE for subsequent doses after placing CPAP mask (i.e. do not remove mask to administer SL doses).
- Allow patient to dangle legs, if possible.
**Respiratory Distress**

- Cardiac monitor
- Consider 12-lead ECG
- SpO$_2$ and EtCO$_2$ monitoring

**Asthma/reactive airway disease**

- ALBUTEROL 2.5 mg in 3.0 mL HHN; repeat until improvement
- DUONEB 2$^{nd}$ & 3$^{rd}$ HHN
  - **additional HHNs use ALBUTEROL**
- Consider CPAP

**Chronic lung disease with deterioration**

- ALBUTEROL 2.5 mg in 3.0 mL HHN; repeat until improvement
- DUONEB 2$^{nd}$ & 3$^{rd}$ HHN
  - **additional HHNs use ALBUTEROL**
- Consider CPAP
- METHYPREDSINOLONE 125 mg IV/IO

**Impending Respiratory Failure:**

- EPINEPHRINE
  - 0.3 – 0.5 mg (0.3 – 0.5 mL) IM 1:1,000
  - 0.1 mg IV 1:10,000 repeat as needed, max 0.3 mg
- METHYPREDSINOLONE 125 mg IV/IO
- MAGNESIUM SULFATE 2 gm IV over 20 min

**Pearls:**

- Duoneb equivalent can be achieved by combining 0.5 mg IPRATROPIUM in 2.5 mg ALBUTEROL.
- Signs of impending respiratory failure include: altered mental status, inability to maintain respiratory effort, cyanosis.
- If patient > 45 years or previous cardiac history, consider contacting **Medical Control**.
Blood glucose testing
Cardiac Monitor
Keep SpO₂ > 94%

MIDAZOLAM 2-5 mg IV/IO/IM/IN q 5 min to max total dose of 10 mg
Call for additional orders for prolonged seizure activity

Late pregnancy (hypertensive), suspect eclamptic seizure

Yes

MAGNESIUM SULFATE 4.0 gm IV/IO over 20 min

Pearls:
- **Eclamptic seizure/ob patients** showing signs of Magnesium Sulfate toxicity (respiratory depression, hypotension or bradycardia):
  - Consider administering 5 mL 10% Calcium Chloride slow IV/IO push over 5 minutes.
- Benzodiazepines are effective in terminating seizures; do not delay IM/IN administration while initiating an IV.
- Status epilepticus is defined as two or more seizures successively without an intervening lucid period, or a seizure lasting over five minutes.
- Consider EtCO₂ monitoring.
Suspect Sepsis if suspected infection and 2 or more of the following:
- Temperature > 100.4°F or < 96.8°F
- Respiratory rate > 20
- Heart rate > 90

Suspect Severe Sepsis if one of the following in addition to the above:
- Acute Hypoglycemia or Hyperglycemia
- Systolic BP < 90 mmHg or Mean Arterial Pressure (MAP) < 65 mmHg
- EtCO₂ < 25 mmHg

If unable to maintain SBP > 90 mmHg or MAP > 65 mmHg, following fluid administration:

LEVOPHED 2-20 mcg/min IV/IO infusion titrate to MAP > 65 mmHg

OR

EPINEPHRINE Infusion 2-10 mcg/min IV/IO infusion; titrate to keep SBP > 90 mmHg

- Blood pressure assessed every 5 min while titrating EPINEPHRINE infusion to maintain MAP > 65 mmHg or systolic blood pressure of > 90 mmHg
- Monitor ECG continuously

Pearls:
- Hypotension can be defined as a SBP of < 90 mmHg or MAP < 65 mmHg. This is not always reliable and should be interpreted in context and patient’s typical BP, if known.
- Shock may be present with a normal BP initially.
- Mean Arterial Pressure (MAP): MAP = ((DBP x 2) + SBP)/3.
Shock – Cardiogenic

For HR between 60 and 120

AND

SBP < 90 mmHg or MAP < 65 mmHg

- OXYGEN SpO₂ ≥ 94%
- Vascular access – Large bore IV preferred, obtain two if possible
- Consider EtCO₂ monitoring
- 12-Lead ECG
- Assess lung sounds
  - If clear, administer bolus of 500 mL NS to max of 2000 mL
  - Reassess lung sounds after each 500 mL given

LEVOPHED 2-20 mcg/min IV/IO infusion titrate to MAP > 65 mmHg

OR

EPINEPHRINE 2-10 mcg/min IV/IO infusion titrate to MAP > 65 mmHg

OR

DOPAMINE 5-20 mcg/kg/min IV/IO infusion titrate to keep SBP > 90 mmHg and/or MAP > 65 mmHg

Pearls:
- Hypotension can be defined as a SBP of < 90 mmHg or MAP < 65 mmHg. This is not always reliable and should be interpreted in context and patient’s typical BP, if known.
- Shock may present with a normal BP initially.
- Mean Arterial Pressure (MAP): MAP = ((DBP x 2) + SBP) / 3.
Rapidly identify and control external hemorrhage

Administer fluid boluses to maintain MAP > 65 mmHg

Consider EtCO₂ monitoring

Prevent Hypothermia

If time of onset is < 3 hours

- TRANEXAMIC ACID  1 g IV/IO infusion over 10 minutes

Pearls:
- Hypotension can be defined as a SBP of < 90 mmHg or MAP < 65 mmHg. This is not always reliable and should be interpreted in context and patient’s typical BP, if known.
- Shock may present with a normal BP initially.
- Mean Arterial Pressure (MAP): MAP = ((DBP x 2) + SBP) / 3.
- For suspected pelvis injury, secure with circumferential compression or commercial device.
- Causes of massive hemorrhage may include, but are not limited to, trauma, postpartum hemorrhage, GI bleeding and esophageal varices.
Smoke Inhalation

Individuals may present with soot around nose and mouth after exposure to smoke from a structure fire or other sources (vehicle fire, industrial gases, confined spaces, etc.)

- Keep SpO$_2$ ≥ 94%
- Ventilation management
- Cardiac monitor

- Vascular Access
- NS bolus 500 mL up to max 2000 mL for hypoperfusion

Other treatment protocols as indicated

Complete Starting Dose: 5 g

1. Reconstitute: Place the vial in an upright position. Add 200 mL of 0.9% Sodium Chloride injection* to the vial using the transfer spike. Fill to the line.

*0.9% Sodium Chloride injection is the recommended diluent (diluent not included in the kit). Lactated Ringers injection and 5% Dextrose injection have also been found to be compatible with hydroxocobalamin and may be used if 0.9% Sodium Chloride is not readily available

2. Mix: The vial should be repeatedly inverted or rocked, not shaken, for at least 60 seconds prior to infusion.
   - CYANOKIT solutions should be visually inspected for particulate matter and color prior to administration
   - Discard solution if particulate matter is present or solution is not dark red

3. Infuse Vial: Use vented intravenous tubing, hang and infuse over 15 minutes.

If the patient presents with cardiac arrest, hypotension, altered mental status or other signs and symptoms consistent with Cyanide (CN) poisoning, administer:

HYDROXOCOBALAMIN 5.0 g IV over 15 min

* Depending on the severity of the poisoning and the patient’s response, a second dose of 5.0 g may be administered by IV infusion up to a total dose of 10.0 g. The rate of infusion for a second dose may range from 15 min (for patients in extremis) to 2 hours, as clinically indicated.

Pearls:
- Signs and symptoms consistent with Cyanide (CN) poisoning include:
  - Weakness, dizziness, headache, stupor, dilated pupils, dyspnea
  - Tachypnea, tachycardia, nausea, vomiting, tightness in the chest
  - Altered LOC, cardiovascular collapse, combativeness, confusion
  - Plasma Lactate concentration ≥ 8 mmol/L
  - Late signs: Cardiac arrest, apnea, bradypnea, hypotension, seizures
- Low EtCO$_2$ can be indicative of an elevated serum lactate level (less than 25).
- If the medication is not available on scene do not delay transport waiting for it.
- Decide early on if you want to intubate as burned airways swell, making intubation difficult.
Title
July 30, 2018

Positive Stroke Assessment
≥ 18 Years Old
Within last 6 hours onset of “last seen well”
Stroke or head trauma in last 3 months
Recent intracranial or intraspinal surgery in last 3 months
Major surgery in past 2 weeks
Active bleeding

Vascular Access

Document:
- Last known normal (onset)
- Witness with phone number
- Perform and document Cincinnati Stroke Scale

- Perform and document FAST-ED
- Findings suggestive of LVO based on FAST-ED score of ≥ 4?

Yes
- Last known well less than 6 hours. If yes, direct transport to comprehensive stroke center
- Call stroke pre-alert

No
- Transport to nearest stroke center
- Call stroke pre-alert

Cardiac Monitor
12-Lead ECG
Blood glucose testing

If blood glucose < 60, see Hypoglycemia protocol

Stroke Pre-Alert Criteria

Indication
- Positive Stroke Assessment
- ≥ 18 Years Old
- Within last 6 hours onset of “last seen well”

Contraindication
- Stroke or head trauma in last 3 months
- Recent intracranial or intraspinal surgery in last 3 months
- Major surgery in past 2 weeks
- Active bleeding

Pearls:
- Transporting agency should draw for destination hospital blood samples. The sequence should be blue, gold, green, lavender, filled completely. Label appropriately.
PEDIATRIC TREATMENT PROTOCOLS
Pediatric Airway Obstruction

Is the patient conscious or unconscious?

Conscious

- Ask patient to speak or cough to establish level of obstruction
- If unable to speak, use age appropriate techniques to dislodge the obstruction:
  - Infants < 1 year of age – provide 5 back blows and 5 chest compressions until the foreign body is relieved or the patient becomes unconscious
  - > 1 year of age – provide abdominal thrusts until foreign body relieved or the patient becomes unconscious
- Suction as needed
- Continually monitor SpO₂

Unconscious

- Place patient in supine position
- Open the airway with the appropriate method
- Perform finger sweep if object is visible
  **DO NOT PERFORM BLIND FINGER SWEEPS**
- Start CPR with chest compressions – do not perform a pulse check
- After 1 cycle of compressions, open the airway
- Attempt to visualize the obstruction – ventilate with 2 breaths
- If the obstruction is not resolved, continue with cycles of chest compressions and ventilations
- Attempt to visualize the obstruction with a laryngoscope and remove it with the Magill forceps – take care not to cause further obstruction
- If unsuccessful, a Needle Cricothyrotomy may be necessary

Unconscious

Conscious

Pearls:
- If the patient presents with trismus and noisy respirations, insert a NPA and attempt to assist ventilations with a BVM.
- Avoid hyperventilation.
- Maintain EtCO₂ at 35-45.
Anaphylaxis is defined as an acute onset of an illness (over minutes to several hours) involving the skin, mucosal tissue, or both (e.g., generalized hives, pruritus or flushing, swollen lips-tongue-uvula) and respiratory compromise (e.g., dyspnea, wheeze-bronchospasm, stridor, reduced peak expiratory flow, hypoxemia) and/or reduced blood pressure (BP) or associated symptoms of end-organ dysfunction (e.g., hypotonia [collapse] syncope, incontinence).

- Consider Vascular Access
- Ventilation Management
- Consider Cardiac Monitor

**MILD** – Generalized hives, swelling, itching:
- DIPHENHYDRAMINE 1.0 mg/kg IV/IM/IO/PO (max 25 mg)

**MODERATE** - Mild symptoms with wheezing and difficulty swallowing:
- DIPHENHYDRAMINE 1.0 mg/kg IV (max 25 mg)
- ALBUTEROL unit dose 2.5 mg in 3.0 mL by nebulizer as needed
- EPINEPHRINE 0.01 mg/kg 1:1,000 IM (0.3 mg max) (in anterior thigh)

**SEVERE** - Impending respiratory failure and hypotension:
- EPINEPHRINE 0.01 mg/kg 1:1,000 IM (0.3 mg max)
- DIPHENHYDRAMINE 1.0 mg/kg IV (max 25 mg)
- METHYLprednisolone 1 mg/kg IV/IO
- EPINEPHRINE 0.01 mg/kg of 1:10,000 IV, followed by 20 mL/kg fluid bolus (0.3 mg max), may repeat PRN

Treat signs and symptoms of shock as necessary
Patient restraint – when patient is a threat to themselves, bystanders or EMS personnel

- Patients may be restrained with soft restraints
- Restraining opposing muscle groups (swimmers position) is most effective; never restrain in prone/hog-tied position
- Assess distal CMS after restraint, every 10 minutes
- Maintain and monitor the oxygen saturation
- Obtain vascular access as needed
- Apply cardiac monitor as needed – **Required with chemical restraint**
- Document reasons for restraint
- Incarcerated person may be restrained at the discretion of Law Enforcement
  - For handcuffed patients, request Law Enforcement accompaniment

Consider *Pediatric Pain Management/ Sedation* protocol
Some patients may bypass the nearest trauma center and be directly transferred to a burn center based on the destination protocol.

### Chemical Burns/Hazmat Contamination
- Protect rescuer from contamination
- Remove all clothing and solid chemical which might provide continuing contamination
- Decontaminate patient using running water for 15 minutes if patient is stable
- Assess and treat associated injuries and evaluate for systemic symptoms
- Wrap burned area in clean dry cloth
- Keep patient warm after decontamination
- Contact hospital as soon as possible with type of chemical contamination for consideration of additional decontamination prior to entry into ED

#### Consider Pediatric Pain Management/Sedation protocol

### Electrical Burn/Lightning
- Protect rescuers from live electric wires
- Separate victim from electrical source when safe for rescuers
- Initiate CPR as needed
  - For victims in cardiac arrest, treatment should be early, aggressive, and persistent
  - Victims with respiratory arrest may require only ventilation and oxygenation to avoid secondary hypoxic cardiac arrest
  - Resuscitation attempts may have high success rates and efforts may be effective even when the interval before the resuscitation attempt is prolonged
- Place patient on cardiac monitor
- Obtain vascular access
- Treat any thermal burns as outlined above
- Assess for other injuries

#### Consider Pediatric Pain Management/Sedation protocol
- Treat dysrhythmias per protocol
Some patients may bypass the nearest trauma center and be directly transferred to a burn center based on the destination protocol.

**Thermal Burns**
- Remove clothing which is smoldering and non-adherent to the patient
- Assess oxygenation and administer OXYGEN as needed
- Assess and treat associated trauma
- Remove rings, bracelets and other constricting objects
- Determine burn body surface area (BSA)
  - If < 10% body surface area burned, use moist saline dressing for patient comfort
  - If burn is moderate to severe (> 10% BSA), cover with clean, dry dressings
- Obtain vascular access
- Administer IV fluids as follows:
  - ≤ 5 years old – 125 mL per hour
  - 6-12 years old – 250 mL per hour

**Pearls:**
- Parkland Burn Formula – 4 mL NS x BSA (%) x body weight (kg) = total fluids
  - Administer 50% of total fluids in first 8 hours from time of injury
  - Administer 50% of total fluids over next 16 hours
- BSA is calculated for partial thickness and full thickness burns.
Pediatric Cardiac - Arrest

Washoe County Regional Protocols

**Pediatric Cardiac - Arrest**

- Unconscious and unresponsive
- Pulseless
- Does not meet Resuscitation/Prehospital Death Determination protocol

- Begin CPR - pulse check/rhythm interpretation every 2 minutes
  - Continue CPR following all pulse checks as indicated by Pt condition
- Place patient on cardiac monitor or AED
- Manage airway as indicated by Pt condition
- Consider reversible causes

**VF, pVT, TdP**

- Defibrillate at 2 J/kg
- Obtain vascular access
- EPINEPHINE 0.01 mg/kg 1:10,000 IV/IO or 0.1 mg/kg 1:1,000 ETT every 3-5 minutes
- Consider BIAD or ETT

**Asystole/PEA**

- Obtain vascular access
- EPINEPHINE 0.01 mg/kg 1:10,000 IV/IO or 0.1 mg/kg 1:1,000 ETT every 3-5 minutes
- Consider BIAD or ETT

**Shockable rhythm**

- Check pulse if organized rhythm
- Use Asystole/PEA as indicated
- Consider consultation of Medical Control for termination of efforts
  - Minimum of 3 rounds of medication are required prior to contact

**Pearls:**
- Hypoxia is the leading cause of cardiac arrest in pediatric patients.
- Use caution when administering two or more ventricular antidysrhythmics, as it may have a proarrythmic effect.
- Efforts should be directed at high quality and continuous compressions with limited interruptions and early defibrillation when indicated.
- DO NOT HYPERVENTILATE.
- Reassess and document ETT placement using auscultation and EtCO₂ capnography.
- Adult paddles/pads may be used on children weighing greater than 15 kg.
Ventilation Management (Primary cause of Bradycardia in pediatrics is hypoxia)
Cardiac Monitor
Establish vascular access

HR < 60 bpm causing hypotension, altered mental status, poor perfusion, or shock

CPR
EPINEPHRINE 0.01 mg/kg IV/IO 1:10,000 q 3-5 min; MAX single dose 1 mg
ETT 0.1 mg/kg 1:1,000

If Refractory:
ATROPINE for primary AV Block or increased vagal tone
0.02 mg/kg IV/IO q 5 min
- Min single dose 0.1 mg – max single dose 0.5 mg
- ETT: 0.04 mg/kg
Consider transcutaneous pacing with sedation

Pearls:
Emergency TCP is indicated in bradycardia due to complete heart block or sinus node dysfunction unresponsive to ventilation, oxygenation, chest compressions, and medications, especially if it is associated with congenital or acquired heart disease.
Pediatric Cardiac - Narrow Complex Tachycardia with Pulses

- Infant Rate ≥ 220  Child Rate ≥ 180
- Vascular Access
- Consider 12-Lead ECG

SVT (Regular)  
Yes  
Hypotension, altered mental status, signs of shock, chest pain, heart failure  
No  
Supportive care

Attempt vagal maneuvers while obtaining proximal IV access

ADENOSINE 0.1 mg/kg rapid IVP may be followed by 10 mL NS flush

ADENOSINE 0.2 mg/kg rapid IVP may be followed by 10 mL NS flush (May repeat 1 additional time)

Consider Pediatric Pain Management/Sedation protocol

SYNCHRONIZED CARDIOVERSION 0.5-1.0 J/kg  
Escalating to 2.0 J/kg if ineffective

Contact Medical Control for further orders

Pearls:
- QRS width > 90 ms is considered wide and possibly SVT with aberrancy and rarely VT.
- May go directly to Cardioversion at any time if severely symptomatic or patient deteriorating.
- Consider alternate causes such as fever, dehydration, caffeine/energy drink consumption, electrolyte imbalance, drug use.
Hypotension, altered mental status, signs of shock, chest pain, heart failure; go directly to electrical therapy.

**Torsades de Pointes**
- **MAGNESIUM SULFATE** 25-50 mg/kg IV max 2 g over 20 min
- Consider sedation MIDAZOLAM 0.2 mg/kg IV; max single dose 5 mg
- DEFIBRILLATE 2 J/kg
- Repeat DEFIBRILLATION 4 J/kg

**Ventricular Tachycardia**
- **AMIODARONE 5 mg/kg IV/IO** over 20 min
- Consider sedation MIDAZOLAM 0.2 mg/kg IV max single dose 5 mg
- SYNCHRONIZED CARDIOVERSION
  - Start at 0.5 to 1 J/kg
- Repeat SYNCHRONIZED CARDIOVERSION 2 J/kg

**Pearls:**
- Consider most wide complex tachycardias in children as an aberrantly conducted SVT. Obtain 12 lead ECG if practical, but do not delay treatment.
- May go directly to defibrillation in Torsade de Pointes if severely symptomatic.
**Pediatric Fever**

- Maintain SpO₂ ≥ 94%
- Manage airway
- Check blood glucose level

If patient:
- Has a temperature ≥ 100.4°F
- Has not had ACETAMINOPHEN in past 4 hours

Administer 15 mg/kg ACETAMINOPHEN suppository PR (may administer PO using the child’s home OTC medication)

If Hypoglycemic, see Pediatric Hypoglycemia/Hyperglycemia protocol

Treat continuous/recurrent seizures per Pediatric Seizure protocol

**Pearls:**
- Do not utilize cooling measures in a pediatric patient < 28 days of age.
- Excessive fluid boluses provided to febrile children may lead to complications – administration of IV fluid boluses should be undertaken with extreme caution.
- Consider a pediatric patient to have meningitis or sepsis until proven otherwise.
- Cocaine, amphetamines and salicylates may elevate body temperatures.
- Sweating generally disappears as body temperatures rise over 104°F.
- Intense shivering may occur as patient is cooled.
- Remove clothing and begin passive cooling. Do not use cold packs or ice to cool the patient.
- Dropping the temperature of a patient too quickly may cause seizures.
Pediatric Hyperglycemia/Hypoglycemia

- Establish baseline level of consciousness
- Manage the airway and breathing as indicated by the patient’s condition
- Consider possible reversible causes prior to placement of an advanced airway
- Consider Cardiac Monitor

If BGL > 250 mg/dl NS bolus 10-20 mL/kg over 1 hour

- BGL < 60 mg/dl (< 40 mg/dl in Neonates)
- ORAL GLUCOSE if the patient is alert/ able to protect their own airway
  - ≤ 28 days D10, 2 mL/kg IV/IO/UV
  - > 28 days D10 or D25, 2 mL/kg IV/IO
- Max single dose 25 gm
- If no IV Access, GLUCAGON:
  - 0.5 mg IM (< 20 kg)
  - 1.0 mg IM (> 20 kg)
- Reassess BGL after each intervention as necessary; titrate to effect

Pearls:
- Neonate considerations for infants ≤ 28 days old (4 weeks).
- Heel stick for patients < 6 months old.
- Fluid management in DKA is complex and may contribute to risk of cerebral edema.
**Pediatric Hyperthermia/Heat Emergency**

**Heat Exhaustion**
- Body temperature up to 104°F/40°C
- Minor CNS changes, weakness, dizziness, fainting
- Nausea, headache, dilated pupils, no appetite
- Skin clammy, pale and moist
- Muscle cramps/pain
- NS bolus 20 mL/kg IV/IO; maintain age appropriate SBP ≥ 70 + (2 x age); max 60 mL/kg

**Heat Stroke**
- Body temperature 104°F/40°C or greater
- Altered mental status or loss of consciousness
- Convulsions, seizures
- Tachycardia, hypotension
- Skin (hot, red, dry)
- Severe vomiting or diarrhea
- NS bolus 20 mL/kg IV/IO; maintain age appropriate SBP ≥ 70 + (2 x age); max 60 mL/kg

- Consider Cardiac Monitor and attempt to obtain body temperature
- Remove patient from hot environment and remove clothing
- Begin active cooling of patient

Treat seizures per the *Pediatric Seizure* protocol

**Pearls:**
- Heat exhaustion can rapidly progress to heat stroke if untreated.
- Heat stroke requires very aggressive cooling.
- Active cooling includes application of cold packs (not directly on skin), fanning, air conditioner or air movement.
- Intense shivering may occur as patient is cooled, discontinue aggressive cooling methods.
- Sweating generally disappears as body temperatures rise over 104°F/40°C.
- Wet sheets without good airflow may increase body temperature.
- Neonate ≤ 28 days fluid bolus 10 mL/kg IV/IO.
Pediatric Hypothermia/Cold Emergency

- Remove wet clothing and protect from environment
- Monitor temperature

Localized cold injury

- General wound care
- DO NOT rub skin to warm
- DO NOT allow refreezing

Systemic hypothermia

- Active warming measures
- Vascular access
- Cardiac Monitor
- Consider warm NS bolus 20 mL/kg IV/IO; maintain age appropriate SBP > 70 + (2 x age), max 60 mL/kg

Transport all severely hypothermic patients regardless of response to treatments. Follow appropriate protocols for other treatment/transport decisions.

<table>
<thead>
<tr>
<th>Core Temperature</th>
<th>Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>93.2°F – 96.8°F</td>
<td>Passive re-warming and active external re-warming</td>
</tr>
<tr>
<td>86°F – 93.2°F</td>
<td>Passive re-warming and active external re-warming to trunk areas only</td>
</tr>
</tbody>
</table>

**Patient with pulse**

<table>
<thead>
<tr>
<th>Core Temperature</th>
<th>Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start CPR, defibrillate once if indicated</td>
<td></td>
</tr>
</tbody>
</table>

**Patient without a pulse**

<table>
<thead>
<tr>
<th>Core Temperature</th>
<th>Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 86°F</td>
<td>CPR, withhold IV medications, limit to one shock for VF/VT/Torsades</td>
</tr>
<tr>
<td>&gt; 86°F</td>
<td>CPR, give IV medications at longer intervals, repeat defibrillation for VF/VT/Torsades, passive re-warming and active external re-warming to trunk areas only</td>
</tr>
</tbody>
</table>

**Pearls:**
- Extremes of age are more prone to cold emergencies.
- If temperature is unknown, treat the patient based on suspected temperature.
- For the severely hypothermic patient, perform procedures gently and monitor cardiac rhythm closely.
- Active warming includes hot packs that can be used on the armpit and groin; care should be taken not to place the packs directly on the skin.
- If available, core temperature is preferred.
Pediatric Medication Assisted Intubation

For analgesia or attenuation of increased ICP:
- FENTANYL 1-3 mcg/kg IV/IO

Sedation and Induction:
- KETAMINE 1-2 mg/kg IV/IO
  OR
- MIDAZOLAM 0.2 mg/kg IV/IO

As patient jaw relaxes, proceed with intubation
Consider cricoid pressure (release if vomiting occurs)

If inadequate relaxation is present:
- If KETAMINE was used, proceed to MIDAZOLAM 0.2 mg/kg IV/IO
- MIDAZOLAM dose may be repeated at 0.2 mg/kg IV/IO

Indications:
- Contact Medical Control

Contraindications:
- Upper Airway Obstruction
- Tracheal obstruction (foreign body, tumor)
- Suspected pharyngeal infection (epiglottitis, peritonsilar or retropharyngeal abscess)

Pearls:
- Pharmacological agents are used to assist the provider in performing intubation in patients with high intubation difficulty due to excessive gag reflux. In these instances, protecting the airway is a potentially life-saving maneuver. These patients may include: Isolated Head Trauma, Multisystem Trauma, Overdose, Status Epilepticus, Respiratory Failure, Severe Burns, or based on anticipated clinical course.
- Most pediatric airways can be effectively managed with BLS interventions.
- Consider Vascular Access
- NS 20 mL/kg IV; may repeat up to 60 mL/kg as needed
- Consider Cardiac Monitor

ONDANSETRON
0.15 mg/kg IV/IO/IM up to max dose 4.0 mg; may repeat x 1 in 20 minutes
Pediatric Neonatal Resuscitation

- Provide warmth
- Assure open airway
- Clear secretions if needed
- Dry baby
- Stimulate

**HR < 100, gasping, or apnea?**

- Yes
  - PPV 40-60/min
  - Monitor SpO₂
  - Cardiac Monitor

- No
  - Labored breathing or persistent cyanosis?
    - Yes
      - Position and clear airway
      - Monitor SpO₂
      - O₂ as needed
    - No
      - Post-Resuscitation care

**HR < 100?**

- Yes
  - Ventilation Management - Corrective steps may include intubation

- No
  - HR < 60?
    - Yes
      - CPR 3:1 ratio
      - Intubate
      - PPV
      - 100% O₂
      - Vascular Access
    - No
      - EPINEPHRINE 0.01 mg/kg (0.1 mL/kg) 1:10,000 IV/IO q 3-5 min as needed for HR < 60 (ETT dosing 1 mL/kg)

- Consider contacting Medical Control
- Consider NS 10 mL/kg x 1
# Pediatric Neonatal Resuscitation

## APGAR

<table>
<thead>
<tr>

<td>No response</td>
<td>Grimace</td>
</tr>
<tr>
<td><strong>Appearance/Skin Color</strong></td>
<td>Blue-Grey, pale all over</td>
<td>Normal, except extremities</td>
</tr>
<tr>
<td><strong>Respiration</strong></td>
<td>Absent</td>
<td>Slow, irregular</td>
</tr>
</tbody>
</table>

## Pearls:
- Neonate considerations for infants < 28 days (4 weeks).
- Deep suctioning is no longer recommended.
- Most newborns requiring resuscitation will respond to BVM, compressions and Epi. For those that do not, consider hypovolemia, pneumothorax, and/or hypoglycemia (BG < 40).
- Document all times (delivery, contraction, duration, frequency).
- Record APGAR at one and five minutes after birth.
- Ideal placement of pulse oximetry is on the right hand for pre-ductal SpO₂. See attached chart for target ranges.
- Pre-term newborns are susceptible to oxygen toxicity.
- Transport mother and infant together whenever possible.
- Maintaining temperature of newborn is essential.

## Targeted pre-ductal SpO₂ after birth

---

Page 67
Pediatric Overdose/Poisoning

Poison Control - (800) 222-1222 OR (775) 982-4129

- Determine cause of poisoning/overdose, treat as appropriate
- Cardiac Monitor

Carbon monoxide (CO)

- Place patient on CO monitor, do not rely on pulse oximeter readings
- If patient’s SpCO is:
  - 0 – 5% - Considered normal for non-smokers. When > 3% with symptoms, consider high flow oxygen and recommend transport. If asymptomatic, no further medical evaluation necessary of SpCO. Counsel patients on signs and symptoms to watch, offer transport to ED, if refused complete AMA.
  - 5 – 10% - Considered normal for smokers, abnormal for non-smokers. If symptoms are present, consider high flow oxygen and recommend transport to ED.
  - 10 – 15% - Abnormal in any patient. Assess for symptoms, consider high flow oxygen and recommend transport to ED.
  - > 15% - Significantly abnormal in any patient. Administer high flow oxygen and recommend transport to ED.
  - > 30% - Consider transport/referral to hyperbaric facility (consider referral to hyperbaric facility if > 25% for patients with ALOC or pregnant).
- If patient has altered LOC, neurological impairment, or > 25% SpCO, treat with 100% O2 and transport to nearest appropriate facility
- Continue supportive therapies as needed

Opiates

NALOXONE 0.1 mg/kg IV/IO/IM/IN, max single dose 0.5 mg; may repeat to a max dose of 10 mg

Tricyclic Anti-Depressants

- For patients with any of the following:
  - Dysrhythmias, or QRS of ≥ 120 ms
  - Hypotension
  - Seizure
  - Cardiac Arrest
- Administer SODIUM BICARBONATE 1.0 mEq/kg IV
- If patient is intubated, ventilate patient to maintain EtCO2 level of 28-30 mmHg

Organophosphate Poisoning (Insecticide)

ATROPINE 0.02 mg/kg IV/IO q 3-5 minutes as needed to decrease secretions and ventilator resistance; min single dose 0.1 mg

Agents:

- Acetaminophen: Initially normal or N/V. Tachypnea and AMS may occur later. Renal dysfunction, liver failure and/or cerebral edema may manifest.
- Depressants: Decreased HR, BP, temp and RR.
- Anticholinergic: Increased HR, increased temperature, dilated pupils and AMS changes.
- Insecticides: May include S/S of organophosphate poisoning.
- Solvents: N/V, cough, AMS.
- Stimulants: Increased HR, BP, temperature, dilated pupils, seizures, and possible violence.
- TCA: Decreased mental status, dysrhythmias, seizures, hypotension, coma, death.
- Beta Blocker Overdose: call for possible administration of GLUCAGON.
- Calcium channel blocker: call for possible administration of CALCIUM CHLORIDE and/or GLUCAGON.
**Pearls:**

- Powdered HYDROXOCOBALAMIN will be reconstituted with 200 cc 0.9% normal saline or lactated ringers. Then repeatedly invert for 60 seconds PRIOR TO administration. DO NOT SHAKE.
- If patient is suspected to have narcotic overdose/hypoglycemia, administer NARCAN/GLUCOSE prior to BIAD device/intubation.
- CALCIUM CHLORIDE is contraindicated in patients with suspected digitalis toxicity.
- Cyanide toxicity should be suspected for any patient being treated for Carbon Monoxide toxicity from smoke inhalation. Conscious patients with symptoms will require Medical Control prior to administration.
- Consider a second line if possible for administration and avoidance of possible medication incompatibilities.
- For suspected ingestion, consider NG tube placement.
- Overdose or toxin patients with significant ingestion/exposure should be closely monitored and aggressively treated. Do not hesitate to contact Medical Control if needed.
- In the case of cyanide poisoning, altered mental status may be profound. Profound altered mental status can be defined as a deficit that includes disorientation, bewilderment and difficulty following commands.

**Cyanide Exposure**

For known cyanide poisoning in the absence of exposure to smoke, refer to the cyanide antidote parameters contained within the *Pediatric Smoke Inhalation* protocol.
Assess and document patient’s condition and vital signs before and after treatment (at minimum every 15 minutes). Pain should be assessed using a combination of physiologic indicators, including but not limited to, 1-10 pain scale, and Bloomsbury Sedation Scale.

- Keep \( \text{SpO}_2 \geq 94\% \)
- Vascular Access
- Consider Cardiac Monitor

Comfort measures:
- Patient positioning
- Splinting
- Ice

- NITROUS OXIDE as long as the patient is able to follow directions
- FENTANYL 1.0 mcg/kg IN/IM/Slow IV/IO may repeat q 5 as needed
- MORPHINE SULFATE 0.1 mg/kg IV/IO/IM max single dose 5 mg, may repeat q 10 as needed
- KETAMINE 0.3 mg/kg IV/IO/IM/IN max single dose 30 mg, may repeat q 15 min as needed

Contact Medical Control for additional doses

MIDAZOLAM 0.2 mg/kg IV may repeat as needed

Bloomsbury Sedation Scale
3= agitated/restless
2= awake/comfortable
1= awake/calm
0= roused by voice, remains calm
-1= roused by movement/stimulation
-2= roused by painful stimulation
-3= cannot arouse

Pearls:
- Ophthalmic anesthetics may be used for ocular injuries, 1-2 drops, as needed.
- Consider prophylactic ONDANSETRON use when administering pain medication.
- Give pain management cautiously to patients who are bradycardic.
- Pain severity (1-10) is a vital sign to be recorded before and after medication administration and patient hand off.
- Monitor BP and respirations closely as sedative and pain control agents may cause hypotension and/or respiratory depression.
- Consider patient’s age, weight, clinical condition, use of drugs/alcohol, exposure to opiates, when determining initial opiate dosing. Weight based dosing may provide a standard means of dosing calculation, but does not predict response.
- Exercise caution when administering opiates and benzodiazepines; this combination results in deeper sedation with significant risk of respiratory compromise.
Pediatric Respiratory Distress

- Cardiac monitor
- SpO₂ and EtCO₂ monitoring

**Bronchospasm/Asthma/Reactive Airway Disease**

ALBUTEROL 2.5 mg in 3.0 mL via HHN until symptoms improve

Duoneb 2⁰⁰ & 3⁰⁰ HHN ** additional HHNs use ALBUTEROL

If patient’s condition deteriorates, consider:
EPINEPHRINE 0.01 mg/kg 1:1,000 IM anterior thigh q 15 mins; MAX 0.3 mg

**Impending Respiratory Failure:**
EPINEPHRINE 0.01 mg/kg of 1:10,000 q 3-5 mins IV/IO; MAX 1 mg
  - ETT: 0.1 mg/kg 1:1,000 EPINEPHRINE q 3-5 mins

METHYPREDNISLOLONE 1 mg/kg IV/IO; MAX 125 mg

**Status Asthmaticus**
MAGNESIUM SULFATE 25-50 mg/kg mixed in 100 mL NS IV infusion over 20 mins; MAX 2 gm

**Suspected Croup**

< 6 months 0.25 mL 2.25% RACEMIC EPINEPHRINE in 3 cc NS via HHN
  OR

< 6 months 0.25 mg of EPINEPHRINE in 3 cc NS via HHN (may repeat x 1 in 20 minutes)

> 6 months 0.5 mL 2.25% RACEMIC EPINEPHRINE in 3 cc via HHN
  OR

> 6 months 0.5 mg of EPINEPHRINE in 3 cc via HHN (may repeat x 1 in 20 minutes)

**Pearls:**
- Duoneb equivalent can be achieved by combining 0.5 mg IPRATROPRIUM in 2.5 mg ALBUTEROL.
- Be prepared to assist ventilations as needed.
- Pulse oximetry and end tidal continuous waveform capnography must be monitored.
- Allow the patient to assume a position of comfort.
- Respiratory distress secondary to drowning may require PEEP and/or nebulizer treatment.
- Croup may respond positively to cold environment and nebulized saline.
Pediatric Seizure

- Protect patient from injury
- Ventilation management
- SpO₂ > 94%
- Consider Cardiac Monitor
- Consider Vascular access
- Blood glucose testing

**MIDAZOLAM 0.2 mg/kg IV/IO/IM/IN; may repeat in 5 min if prolonged seizure activity without return of consciousness**

**Pearls:**
- Benzodiazepines are well tolerated in pediatrics; do not delay IM/IN administration while initiating an IV.
- Status epilepticus is defined as two or more seizures successively without an intervening lucid period, or a seizure lasting over five minutes.
- Grand mal seizures (generalized) are associated with loss of consciousness, incontinence and or trauma.
- Focal seizures affect only part of the body and are not usually associated with a loss of consciousness.
- Be prepared to address airway issues and support ventilations as needed.

**Temperature > 100.4°F, refer to *Pediatric Fever* protocol**

**If hypoglycemic, refer to *Pediatric Hypoglycemia/Hyperglycemia* protocol**
Pediatric Smoke Inhalation

Individuals may present with soot around nose and mouth after exposure to smoke from a structure fire or other sources (vehicle fire, industrial gases, confined spaces, etc.)

- Keep SpO₂ ≥ 94%
- Ventilation management
- Cardiac Monitor

- Vascular Access
- NS bolus 20 mL/kg up to 60 mL/kg for hypoperfusion

Other treatment protocols as indicated

If the patient presents with cardiac arrest, hypotension, altered mental status or other signs and symptoms consistent with Cyanide (CN) poisoning, administer:

HYDROXOCOBALAMIN 70 mg/kg IV over 15 minutes

**Pearls:**
- Signs and symptoms consistent with Cyanide (CN) poisoning include:
  - Weakness, dizziness, headache, stupor, dilated pupils, dyspnea
  - Tachypnea, tachycardia, nausea, vomiting, tightness in the chest
  - Altered LOC, cardiovascular collapse, combativeness, confusion
  - Plasma Lactate concentration ≥ 8 mmol/L
  - Late signs: Cardiac arrest, apnea, bradypnea, hypotension, seizures
- Low EtCO₂ can be indicative of an elevated serum lactate level (less than 25).
- If the medication is not available on scene do not delay transport waiting for it.
- Decide early on if you want to intubate as burned airways swell, making intubation difficult.
OPERATIONAL PROTOCOLS
AMA Decision Tree

This applies only to the patient who has capacity and is competent: Patient is stable and able to understand and reiterate to you the problem, risks, and consequences of refusal of care.

If in patient’s best interest, consider contacting law enforcement to place patient in protective custody.

Does person fit the definition of a patient?

- Yes
  - Alert and oriented?
    - Yes
      - Suicidal
        - Yes
          - Transport
          - No
        - No
          - Patient < 18 years without legal guardian?
            - Yes
              - Refer to Minors protocol
            - No
              - Meets trauma criteria or life threatening situation?
                - Yes
                  - Consider contacting Medical Control
                - No
                  - Per departmental or agency policy, release patient
  - No
    - Release to self (not a patient), follow departmental policy
Person at risk to harm self or others based upon intoxicated condition – such condition prevents them from safely caring for their own health or safety or the health or safety of others. (NRS 458.270 – Procedure for placing person in Civil Protective Custody)

Evaluate subjective findings (i.e.: primary complaint of HA, LOC, vomiting, seizure, acute wound, chest pain, SOB, abdominal pain)

Evaluate objective findings (awake & alert, able to walk w/o assistance):
- SBP 90 – 180 and DBP < 110
- H.R. 50-120
- SpO2 ≥ 90%
- BGL: > 60
- No suspected trauma/head injury
- No acute medical complications

• Call appropriate law enforcement agency to place person in Civil Protective Custody
• Complete appropriate charting

Transport

Patient is awake and alert; able to ambulate without assistance

• Try to release to a reliable caretaker, otherwise release with instructions not to drive and to go/stay home and rest
• Complete appropriate charting

Transport
Contact Medical Control When:

- EMS judgment suggests consultation with Medical Control Physician necessary
- EMS provider needs assistance in termination of resuscitation or requesting deviation from protocols
- Protocol requires base physicians contact for medication administration or other procedures
- Patient condition not addressed in protocols

Communication Failure:

- Protocol becomes standing order if:
  - Medical Control cannot be contacted (radio/phone failure)
  - Medical Control physician does not answer after reasonable time
- In the event Medical Control cannot be contacted, care will be delivered in the best interest of the patient.
- Medical crew will follow agency specific guidelines for reporting and review

Document:

- Report in accordance with agency policy
- Treatment requests/approved physician orders
- Time of contact and Medical Control physician’s name
The final destination hospital has profound clinical, personal and financial implications for our patients. Hospitals in the Reno/Sparks area offer different specialty services and patients may be better served at specific facilities.

**Base Hospitals**

- Renown Regional Medical Center (RRMC)
- Saint Mary’s Regional Medical Center (SMRMC)
- Northern Nevada Medical Center (NNMC)
- Renown South Meadows Medical Center (RSMMC)
- Reno Veteran’s Administration (VA) hospital is not a base hospital, but is an acceptable destination for patients who request it and are accepted prior to transport. Provide the RVA with patient’s initials and last four ss#. Hospital will provide notification of acceptance or diversion.
- Incline Village Community Hospital (IVCH) is not a base hospital, but is an acceptable destination for patients who request it and are accepted prior to transport.
- Other out-of-area hospitals are acceptable destinations with certain restrictions (i.e. closest hospital to the scene, other appropriate facilities are not bypassed or the patient does not meet trauma criteria).

**Catchment Zone**

Patients who do not have a hospital preference and originate in one of the defined catchment zones will be transported to the appropriate hospital within that zone. Exceptions include clinical findings, hospital diverts and MCIs. The catchment destinations apply to both ground and air units.

**PATIENT DESTINATION TABLE**

</table>
BURN CENTER

- Second and/or third degree burns > 20% body surface area (BSA).
- Second and/or third degree burns > 10% BSA in patients under 10 or over 50 years of age.
- Significant burns that involve the face, hands, feet, genitalia, perineum or major joints.
- Electrical burns, including lightning injury.
- Chemical burns.
- Circumferential burns.
- Inhalation injury.

If the patient meets the criteria AND the burns are not complicated by major trauma, initiate air ambulance response.

TRANSPORT REQUIREMENTS

NAC 450B.774 Procedure when patient refuses transportation to center for treatment of trauma.

1. If a patient at the scene of an injury refuses to be transported to a center for the treatment of trauma after a determination has been made that the patient’s physical condition meets the triage criteria requiring transport to the center, the person providing emergency medical care shall evaluate the mental condition of the patient. If the person determines that the patient is competent, the patient must be advised of the risks of not receiving further treatment at the center.

2. If the patient continues to refuse to be transported to the center for the treatment of trauma, the person providing emergency medical care shall request the patient to sign a statement indicating that the patient has been advised of the risks of not receiving further treatment at the center and continues to refuse to be transported to the center.

3. The person providing emergency medical care shall inform a physician at the location to which the person intends to transport the patient’s refusal to be transported before the person leaves the scene of the injury.

Hospital Diversion – Occasionally, facilities may declare divert status for select patients. (Any facility accredited to care for STEMI or Stroke patients, cannot divert those patients, except in the case of an internal disaster.) Document the reason for the diversion and take the patient to the patient’s second choice or the closest base hospital. Diversion decisions are typically made without medical control contact.

- **Closed** – The hospital has not capacity/resources to accept any ambulance patient.
- **Critical Care** – The hospital has not capacity/resources to accept ambulance patients who have a high probability of requiring ICU admission; ambulance patients who present in the field as high risk for potential or actual life-threatening health problems. Typically, this refers to patients who demonstrate signs and symptoms of Hemodynamic instability; acute respiratory failure; acute MI or severe CP; complete loss of consciousness or other presentations indicative of the need for critical care nursing or ICU admission. Paramedics/RNs are encouraged to contact the ED Base Station physician directly to clarify questions about any potential transport.
- **ED Capacity** – The ED is over-capacity with long treatment delays in triage that could potentially jeopardize the appropriate placement of incoming ambulance patients. Treat the same as a closed divert.
- **Transport Bypass** – The ED is unable to accept ambulance patients in a timely manner. Treat the same as a closed divert.
- **Internal Hospital Disaster** – The hospital has an in-house emergency such as a fire, electrical outage, hazmat or a major malfunction of critical equipment that may preclude the provision of save effective care in the emergency department.
Patient/Family Choice – Patient/family choice should dictate hospital destination unless the patient is excluded due to clinical conditions defined below, or hospital choice is on divert status.

Trauma (Special Resources) – Patients who meet State Trauma Criteria shall be transported to the closest Level 1 or 2 trauma center. In most cases, this is RRMC. If the patient (who is deemed competent) meets trauma criteria, but requests another hospital, the provider should appropriately explain the rationale for transport to the trauma center. If the patient still requests another destination, contact medical control at the closest trauma center and obtain physician approval for diversion. By air, patients less than 14 years of age who meet trauma criteria will be transported, when appropriate, to RRMC or U.C. Davis (whichever is closest).

Nearest facility – If a patient and/or family has no hospital preference, the transport shall be to the designated hospital in the catchment area. If outside the catchment zone, the closest hospital by time.

OB (Special Resources) – Within Washoe County, only RRMC and SMRMC have obstetrical services. Obstetrical patients greater than 20 weeks gestation with complaints related to their pregnancy should not be transported to NNMC or RSMMC.

Neurological Disease/Possible Stroke (Special Resources) – Patients with stroke symptoms, with duration of symptoms less than eight hours will be transported to a Primary Stroke Center. With the exception of divert status for an internal hospital disaster; patients that meet stroke criteria cannot be diverted. Outside the Reno/Sparks area, the patient will be transported to the closest hospital. If the patient, family, or patient’s physician request another hospital, the patient will be taken to the requested hospital.

Pediatrics (Special Resources) – Pediatric patients 12 years of age or younger are to be taken to Renown Regional Medical Center if they present with a need for intubation, assisted ventilation, or critical care. (Respiratory arrest goes to closest emergency department).

Neonatal (Special Resources) – Any patient 28 days of age or younger that presents with a need for intubation or bag-valve-mask ventilation will be taken to a hospital with a neonatal intensive care unit. Any patient born in the field will be taken to a hospital with a labor and delivery department. In both cases, these facilities are RRMC or SMRMC.

Other – Other acceptable reasons for destination selection are physician/facility request during an inter-facility transfer, transporting with/for another agency, such as fixed wing transfers, etc.

Sexual Assault – Victims of sexual assault who do not meet trauma triage guidelines will be transported to the closest hospital or the hospital of their choice if a medical assessment for injuries is requested. The police will be notified by the hospital for subsequent transport to the SART center upon completion of the medical evaluation and treatment.

Exceptions (Nearest facility) – Patients in cardiac arrest or who are in impending arrest, have an airway obstruction, uncontrolled hemorrhage, imminent delivery, or any condition that may be jeopardized by a longer transport are to be taken to the closest emergency department.

Acute Coronary Syndrome (Special Resources) – Any patient who meets the following criteria is taken to a hospital with interventional cardiology capabilities (RRMC, SMRMC, NNMC):

- 12 lead ECG shows evidence of an active STEMI AND/OR
- History of angioplasty, stent placement, or coronary artery bypass graft AND symptoms suggesting acute coronary syndrome. With the exception of divert status for an internal hospital disaster; patients that meet STEMI criteria cannot be diverted.
- Patients with chest pain and non-STEMI symptoms of acute coronary syndrome may be transported to any facility.

MCI – All hospital destinations during a declared MCI are coordinated and assigned by Medical Dispatch Facility.
Notes:
• Divert status (except for internal hospital disaster) does not apply in cases of airway obstruction, severe shock, cardiac arrest, uncontrolled hemorrhage, imminent delivery or any patient that may be jeopardized by the diversion.
• It also does not apply to patients meeting pediatric and trauma criteria or in the case of an MCI.
• If patient is en route to a facility and the facility goes on divert, make an appropriate attempt to reroute the patient to the closest ED that is not experiencing diversion. Should that not be possible, due to the patient’s condition or other circumstance, the patient in transport will not be rerouted and will proceed to the specific ED that was originally identified.
• If a patient demands transport to a hospital on diversion, or if the patient is refusing transport if they will not be taken to their hospital of choice because of the diversion, the patient will be taken to their hospital of choice. Make every effort to inform the patient of the need to go to a hospital not on divert and document the conversation.
Valid POLST indicating DNR or State issued DNR:

- Official document with both patient/legal representative and physician signature on site
- Faxed, copied or electronic version legal and valid
- Verify patient identification
- Verbal instructions from family or friends DO NOT qualify as valid DNR/POLST

Pearls:

- DNR/POLST is **INVALID** if patient indicates they wish to receive life-resuscitating treatment. Document presence of order and how they indicated it was to be revoked. Relay information to future medical providers.
- Family, cannot revoke DNR/POLST unless they hold DPOA/legal guardianship.
- Document presence of a DNR/POLST form with patient’s name, physician name and license number if documented.
- POLST provides instruction of degree of resuscitation.
- Nevada providers can accept DNR/POLST of other states.
- If there is concern about the validity of the DNR/POLST begin BLS and contact **Medical Control**.
A Patient Care Record (PCR) will be completed for each incident/patient encounter, in accordance with current agency Policy.

**Per the Nevada Administrative Code 450B.180 “Patient” means:**
Any person who is sick, injured, wounded, or otherwise incapacitated or helpless and who is carried in an ambulance or air ambulance or is cared for by an emergency medical dispatcher, emergency medical responder, emergency medical technician, advanced emergency medical technician, paramedic or registered nurse.

When providing patient care activities prior to the arrival of the transporting agency, upon the transporting agencies arrival and when prepared to transfer patient care, EMS providers shall provide a verbal report. The verbal report should reflect the patient’s status, the treatments that have been accomplished and the potential treatment plan, if necessary. This transfer of care shall be documented in the Patient Care Report (PCR).
NRS 432B.220 Persons required to make report; when and to whom reports are required; any person may make report; report and written findings if reasonable cause to believe death of child caused by abuse or neglect; certain persons and entities required to inform reporters of duty to report.

NRS 200.5093 Report of abuse, neglect, exploitation, isolation or abandonment of older person; voluntary and mandatory reports; investigation; penalty.

Child Report (under 18)
- Contact appropriate Law Enforcement agency if immediate patient protection is needed
- Washoe County Child Protective Services: 775-785-8600
- Complete appropriate agency reporting form

Elder Report (over 59)
- Contact appropriate Law Enforcement agency if immediate patient protection is needed
- Nevada Health and Human Services Aging and Disability Services: (888) 729-0571
- Complete appropriate agency reporting form

For persons over the age of 17 whose present socioeconomic conditions could benefit from additional resources, but do not require mandatory reporting, refer to regional resources guide.

Pearl:
- If there is a high index of suspicion, report to the appropriate agency and allow them to do the investigation.
Ambulance attendants should be aware that whenever a patient is to be transferred from one medical facility to another by EMS, the transferring physician is responsible for notifying, in advance, the receiving physician of the following:
- Reason for transfer
- Patient condition
- Estimated time of arrival

Attendant should expect that the transferring physician will provide to them the name of the receiving facility and receiving physician, a copy of any available diagnostic tests, x-rays and patient medical records prior to releasing the patient.

Ambulance attendants should only transfer a patient whose therapy required during the transfer lies within the ambulance attendant’s scope, or that the appropriate personnel (registered nurse, respiratory therapist, etc.) accompanies the patient.

Ambulance attendants are authorized to administer or monitor all medications listed on the approved medication list as appropriate for their level of licensure and as per protocol.

ILS and ALS ambulance attendants are authorized to administer or monitor any crystalloid IV solution during the transport.

Arterial lines should be discontinued prior to transport unless appropriate personnel from the initiating facility accompany the patient.

Heparin lock/implantable catheters with/without reservoirs may be closed off and left in place. If they are to be used during transport, then an IV infusion should be established.

Orogastric or nasogastric tubes may be left in place and should either be closed off or left to suction per order of transferring physician.

Orthopedic devices may be left in place at the ambulance attendant’s discretion as to ability to properly transport the patient with existing devices(s) in place.

Transport of patient with IV antibiotic:
- Obtain and document name of antibiotic
- Obtain and document dose and rate of administration
- If unfamiliar with antibiotic, ask about any specific side effects
- Monitor medication to ensure proper administration rate during transport
- Monitor patient for signs and symptoms of any side effect and/or allergic reactions such as nausea/vomiting, diarrhea, changes in LOC, rashes, swelling, SOB, or changes in BP. If any changes noticed; discontinue IV, initiate appropriate treatment, document changes, and inform staff at receiving facility.
Except for circumstances specifically prescribed by law, a minor is not legally competent to consent to (or refuse) medical care. A “minor” is any person under the age of 18.

An “emancipated minor” is an minor who is at least 16 years of age, who is married or living apart from his or her parents or legal guardian, and who is a resident of the county (NRS 129.080) that petitioned the juvenile court of that county for a decree of emancipation.

### Life-Threatening Situation

Immediate treatment and/or transport to a medical facility should be initiated

### Non-Life-Threatening Situation

If a minor has any illness or injury, EMS personnel should make a reasonable attempt to contact a parent or other legally qualified representative before initiating treatment or transport. If this is not possible, EMS personnel should transport the patient to the closest hospital with “implied consent.” Parental consent is not needed for care in non-life-threatening situations when:

- Minor is emancipated
- Parent has given written authorization to procure medical care to any adult (18 or over) taking care of the minor
- Minor is an alleged victim of sexual assault
- Minor seeks prevention or treatment of pregnancy or sexually transmitted infection

### Minors who Refuse Care

If a non-emancipated minor refuses any indicated treatment or transport, EMS field personnel should:

- Attempt to contact parents or other legally qualified representative for permission to treat and transport the minor
- Contact appropriate law enforcement agency and request that the patient be taken into temporary custody in order that treatment or transport can be instituted
- Contact base hospital and apprise them of the situation
Once a physician has identified him/herself as such on scene, than them for their offer of assistance. Then advise him/her that you are operating under the authority of the State of Nevada and under protocols approved by the State of Nevada, which does not allow you to take an order for care from any physician other than an on-duty base station physician or your Medical Director. You are also delivering care under the authority of a Medical Director and standing medical orders.

To avoid confusion and expedite patient care, no individual should intervene in the care of the patient unless the individual is:

- Requested by the attending EMS provider
- Is authorized by the base station physician
- Is capable of delivering more extensive emergency medical care at the scene

If the on-scene physician assumes patient management, he/she accepts responsibility for patient care until the transfer of care is made to the receiving hospital’s physician. This requires the physician to accompany the patient to the emergency department.

If the physician assumes this responsibility, he/she must document this by handwriting their note on a hospital chart form upon arrival at the ED and sign accordingly. The completion of the physician’s note will become part of the patient’s hospital record, and the medic should document the completion of this note in the patient’s ePCR along with the physician’s name and medical license number, if possible. The narrative of the ePCR should reflect what care was performed by the physician upon assuming care.

A physician who has initiated care of a patient before arrival of EMS personnel has accepted responsibility for the management of the patient. EMS personnel should offer all appropriate assistance and support within their scope of practice. Consultation with the base physician should be made to manage conflicts in patient management.

If a physician other than the EMS Medical Director assumes care of the patient, use agency specific procedures for reporting.
MEDICATIONS
## Adult Medications

The following are the authorized medications used by EMS providers in Washoe County. Licensed EMS providers working under the agency permit are authorized, within their level of certification and training, to administer medications as directed by the written treatment protocols.

It is important to note that some dosages and processes vary on an agency basis. It is imperative that each EMS provider is aware of their agency’s internal procedures.

The following section is a reference to medications included by name and dose in the Washoe County Regional protocols; the only purpose of this section is to serve as a reference for the Washoe County Regional Protocols. The formulary may contain information outside of allowed protocols. Individual agencies may or may not utilize these or other approved medications. Please refer to approved medication list included in the appendix of your agency.

**ACETAMINOPHEN (TYLENOL)**

**Pharmacology and Actions**
Thought to produce analgesia by blocking generation of pain impulses, probably by inhibiting prostaglandin synthesis in the CNS or the synthesis or action of other substances that sensitize pain receptors to mechanical or chemical stimulation. It is thought to relieve fever by central action in the hypothalamic heat-regulating center.

**Indications**
Fever

**Contraindications and Precautions**
1. Contraindicated in patients with hypersensitivity to acetaminophen.
2. Avoid concomitant use with ethanol and this increases the risk of hepatic damage.

**Side Effects and Special Notes**
1. Use cautiously in patients with suspected pre-existing liver disease, chronic alcohol use, or chronic hepatitis/jaundice because hepatotoxicity has occurred after therapeutic doses.
2. Many OTC products contain acetaminophen, be aware of this when calculating dosages.
3. Acetaminophen may produce false positive decreases in blood glucose levels in home monitoring systems.

**ADENOSINE (ADENOCARD)**

**Pharmacology and Actions**
1. Naturally-occurring amino acid.
2. Slows conduction through the AV node.
3. Has no effect on accessory tracks such as found in WPW or LGL syndromes.
4. Extremely short duration of action (<10 seconds).
5. May cause brief period of asystole which spontaneously reverts.
6. Almost all patients will report varying degrees of chest pressure or pain after administration of this drug.
7. Many patients will revert to the previous rhythm even after conversion to normal sinus rhythm.

**Indications**
Stable Narrow Complex SVT

**Contraindications and Precautions**
1. Second or third degree heart block, poison or drug induced tachycardia.
2. Atrial fibrillation, atrial flutter, or Ventricular Tachycardia will not be converted by Adenosine.
3. Reduce initial dose to 3 mg if given through a central line.
4. Larger doses may be required in patients taking theophylline or caffeine.
ALBUTEROL (PROVENTIL, VENTOLIN)

Pharmacology and Actions
Albuterol relaxes bronchial smooth muscle by stimulating Beta 2 adrenergic receptors.

Indications
1. Primarily used to treat bronchial asthma, COPD and reversible bronchospasm.

Contraindications and Precautions
1. Causes decrease in serum potassium and should be used with caution in patients with profound hypokalemia.

Side Effects and Special Notes
1. Adverse effects include tremor, nervousness, tachycardia, palpitations and occasionally hypertension.
2. Most patients will have a decrease in heart rate and blood pressure with relief of bronchospasm.
3. Therefore, do not withhold therapy in patients with hypertension and/or tachycardia.

AMIODARONE (CORDARONE)

Pharmacology and Actions
Considered a Class III antiarrhythmic. Complex drug with effects on Sodium, Potassium and Calcium channels as well as alpha and beta adrenergic blocking properties. Thought to prolong the refractory period and action potential duration. Amiodarone has an extremely long half-life (up to 40 days).

Indications
1. Indicated for the treatment of shock, CPR and Vasopressor refractory VF/pulseless VT.
2. Indicated in other life threatening arrhythmias like recurrent and/or hemodynamically unstable VT.

Contraindications
1. None in VF/Pulseless VT.
2. Endotracheal administration is contraindicated.

Precautions
1. May produce vasodilation and hypotension.
2. May have negative inotropic effects.
3. May produce prolonged QT interval.
4. Use with caution in the presence of renal failure.
ASPIRIN

Pharmacology and Actions

Inhibits platelet aggregation and arterial constriction by blocking formation of thromboxane A\textsubscript{2}. This reduces overall ACS mortality, reinfarction, and CVA.

Indications

1. Indicated in all patients with ACS.
2. Indicated in any person with symptoms suggestive of ischemic pain.

Contraindications and Precautions

1. Relatively contraindicated in patients with active ulcer disease.
2. Contraindicated in patients with known hypersensitivity to aspirin.

ATROPINE

Pharmacology and Actions

Atropine is anticholinergic, inhibits acetylcholine at the parasympathetic neuroeffector junction, blocking vagal effects on the SA node; thus enhancing conduction to the AV node and increasing the heart rate.

Indications

1. Atropine is indicated for symptomatic bradycardia and bradyarrhythmias (junctional or escape rhythm).
2. It is also indicated in cases of organophosphate poisoning.
3. It can be administered prior to endotracheal intubation to diminish secretions and block cardiac vagal reflexes.
4. Excellent for vagally induced bradycardia in pediatric patient being intubated.

Contraindications and Precautions

1. The action of atropine cause mydriasis (dilated pupils).
2. Use with caution in presence of myocardial ischemia.
3. Routine use during PEA or Asystole is unlikely to have therapeutic benefit.
4. Unlikely to be effective for hypoxic bradycardia, Type II AV Block, and Third Degree with wide QRS complexes.
CALCIUM CHLORIDE

Pharmacology and Actions
Positive inotrope which increases contractility (the strength of the contraction). Stabilizes myocardial muscle membrane in the setting of hyperkalemia.

Indications
1. Known or suspected hyperkalemia.
2. Hypocalcemia.
3. As an antidote for toxic effects from calcium channel blocker and beta blocker overdose.
4. MgSO₄ overdose.

Contraindications
1. Hyperkalemia due to digitalis toxicity.
2. Do not mix with Sodium Bicarbonate.

DEXTROSE

Pharmacology and Actions
Dextrose is a sugar called glucose or grape sugar containing six carbon atoms. Dextrose is important because it is the primary energy source for the brain.

Indications
1. Indicated for the treatment of known hypoglycemia.

Contraindications and Precautions
1. Contraindicated in intracranial or intraspinal hemorrhage.

Side Effects and Special Notes
1. Extremely hypertonic.
2. Should be administered into a rapid-running IV established in a large vein.
3. Inadvertent extravasation will lead to tissue sloughing and necrosis.
DILTIAZEM (CARDIZEM®)

Pharmacology and Actions
Diltiazem is a calcium channel blocking agent that inhibits the influx of calcium ions during membrane depolarization of cardiac and vascular smooth muscle. Its action is to slow AV nodal conduction and increase the AV nodal refractory period. Diltiazem slows the ventricular rate in patients with a rapid ventricular response during atrial fibrillation or atrial flutter, potentially converts SVT to normal sinus rhythm, and decreases total peripheral resistance in both systolic and diastolic blood pressure.

Indications
1. Narrow complex atrial fibr/flutter with rapid ventricular rate (>150 bpm)
2. SVT refractory to Adenosine. Use after Adenosine for refractory reentry SVT with narrow QRS and adequate blood pressure.

Contraindications and Precautions
1. Patients with impaired left ventricular function or heart failure.
2. Complete heart block.
3. Recently (within past 1 hours) received IV ß-blocker.
4. Patients with WPW and Afib.
5. Sick sinus syndrome.
6. Vtach, wide complex tachycardia, drug/poison induced tachycardia
8. Cautious use in patients who are already taking antihypertensive medications, monitor for hypotension.

Side Effects and Special Notes
1. Hypotension
2. Bradycardia
3. Heart block
DIPEHNHYDRAMINE HYDROCHLORIDE (BENADRYL)

Pharmacology and Actions
Diphenhydramine competes with histamine for H1 receptor sites on effector cells. Prevents, but does not reverse histamine-mediated responses, particularly histamine’s effects on the smooth muscle of the bronchial tubes, gastrointestinal tract, uterus and blood vessels.

Indications
1. One of the most widely used antihistamines for the treatment of anaphylaxis and several allergic reactions.
2. Also used to treat motion sickness and extrapyramidal symptoms.

Contraindications and Precautions
1. Contraindicated in acute asthmatic attack.
2. Should be used cautiously in glaucoma, asthmatic, hypertensive or cardiac patients.

Side Effects and Special Notes
1. Adverse reactions include drowsiness, occasional nausea and dry mouth.
2. Used with Epinephrine in severe anaphylaxis (if not contraindicated).

DOPAMINE HYDROCHLORIDE (INTROPIN)

Pharmacology and Actions
Dopamine is the endogenous catecholamine precursor of norepinephrine. It releases norepinephrine and displays direct and indirect alpha and beta 1 effects. It increases cardiac output and usually elevates heart rate and systolic pressure-systemic vascular resistance is not increased except at higher dosages. It dilates renal and splenic vascular beds by activation of dopaminergic receptors. The alpha effects predominate at higher doses (usually greater than 10 mcg/kg per minute, marked individual variation exists and dose must be guided by clinical response).

Indications
1. Indicated for augmentation of cardia performance and/or renal blood flow in shock and hypoperfusion syndromes due to septicemia, cardiac failure, cardiac surgery, renal failure, trauma and acute myocardial infarction.

Contraindications and Precautions
1. Contraindicated in patients with uncorrected tachyarrhythmias, ventricular/fibrillation or known hypersensitivity.
2. Should be used cautiously in patients with peripheral vascular disease.
3. Any underlying hypovolemia must be corrected, if possible, prior to use.

Side Effects and Special Notes
1. The principal adverse effects include headache, anxiety, tachycardia, chest pain, hypotension, nausea and vomiting.
2. Carefully monitor blood pressure, ECG and urine output throughout the infusion.
3. Extravasation requires discontinuation of the drug.
DOPAMINE INFUSION CHART

Use this chart if you are using a Dopamine concentration of 1600 mcg/ml. Match the weight with the dose and set your dial a flow or pump.

Example: A patient who weighs 50 kg needs dopamine at 5 mcg/kg/min. You need to administer 9 ml/hr or 9 gtts/min using 60 gtts/ml set.

**EPINEPHRINE**

**Pharmacology and Actions**
Epinephrine is an endogenous catecholamine with both alpha and beta adrenergic activity. Epinephrine increases heart rate, myocardial contractility, pulse pressure, cardiac output, systolic and diastolic blood pressure, automaticity, systemic vascular resistance and myocardial work and oxygen consumption. Epinephrine also lowers the threshold for defibrillation and causes bronchodilation.

**Indications**
1. Indicated in cardi arrest, post cardiac arrest, sepsis, bradycardia, distributive shock, bronchial asthma, croup, anaphylaxis and hypotension.

**Contraindications and Precautions**
1. Age > 45, or previous cardiac history (in some settings, consult medical control).
2. Epinephrine will lower the threshold for ventricular fibrillation. Epinephrine’s positive inotropic and chronotropic effects can precipitate or exacerbate cardiac ischemia.

**Side Effects and Special Notes**
1. Epinephrine should not be mixed in the same infusion bag with alkaline solutions or be given concurrently with sodium bicarbonate.
2. May be given via an endotracheal tube if IV access is not available.
3. Higher doses may be required to treat poison or drug induced shock.

ETOMIDATE (AMIDATE)

Pharmacology and Actions

Etomidate is an imidazole derivative that is primarily a hypnotic. It is the most hemodynamically stable of the currently available induction agents. At induction doses of 0.3 mg/kg, it has minimal respiratory or myocardial depression. Etomidate attenuates the rise in intracranial pressure that is associated with laryngoscopy and intubation. It does this by decreasing cerebral blood flow and cerebral metabolic oxygen demand without adversely affecting cerebral perfusion pressure. In healthy, hemodynamically stable patients, the recommended induction dose of 0.3 mg/kg should be used. The onset is 20-30 seconds with full recovery in 7-14 minutes.

Indications

1. Medication assisted intubation
2. Sedation

Contraindications and Precautions

1. Know hypersensitivity to the drug.

Side Effects and Special Notes

1. Etomidate does not release histamine, but it can cause nausea and vomiting, pain on injection, myoclonic movement, and hiccups.
2. A small number of patients will experience pain on injection of Etomidate. This is due to the diluent (propylene glycol) and can be lessened considerably if administered in a large vein, and in conjunction with a rapid intravenous fluid rate.
3. The myoclonic activity following Etomidate injections is secondary to brain stem stimulation and can be mistaken for grand mal seizures.
4. Hiccups are usually not a concern during RSI, but should be recognized as a side effect of Etomidate administration.
5. The best known and most concerning side effect of Etomidate is its reversible blockade of 11 beta-hydroxylase, which decreases both serum cortisol and aldosterone levels. This side effect is much more common with continuous infusions of Etomidate in the intensive care unit setting rather than with a single dose injection utilized for RSI.
FENTANYL

Pharmacology and Actions
Binds with opiate receptors in the CNS, altering both perception of and emotional response to pain through an unknown mechanism.

Indications
1. Relief of severe acute and severe chronic pain.

Contraindications and Precautions
1. Contraindicated in patients with known tolerance to the drug.
2. Additive effects when given with CNS depressants, general anesthetics, hypnotics, MAO inhibitors, other narcotic analgesics, sedatives, and tricyclic antidepressants.

Side Effects and Special Notes
1. For better analgesic effect, administer drug before patient has intense pain.
2. Monitor respiratory status carefully, drug may cause respiratory depression. Naloxone may be used to reverse Fentanyl.
3. Rapid administration may cause chest wall rigidity.

FUROSEMIDE (LASIX)

Pharmacology and Actions
Furosemide is a diuretic that works in the loop of henle. The onset of diuresis following IV administration is within five minutes, with the peak effect occurring within the first half hour.

Indications
1. Furosemide is the indicated therapy in acute pulmonary edema.

Contraindications and Precautions
1. Contraindicated in anuria and in patients with known hypersensitivity to the drug.
2. Excessive diuresis may result in dehydration and reduction in blood volume with circulatory collapse.
3. Patients should be observed for signs of fluid and electrolyte imbalances, namely hyponatremia, hypochloremic alkalosis and hypokalemia.

Side Effects and Special Notes
1. Digitalis therapy may exaggerate metabolic effects of hypokalemia, especially with reference to myocardial activity.
GLUCAGON

Pharmacology and Actions
    Raises blood glucose level by promoting catalytic depolymerization of hepatic glycogen to glucose.

Indications
    1. Hypoglycemia.
    2. Beta blocker and calcium channel blocker overdose/poisoning.

Contraindications and Precautions
    1. Known hypersensitivity to the drug.

Side Effects and Special Notes
    1. Use only the diluent supplied by the manufacturer.
    2. Unstable hypoglycemic diabetic patients may not respond to Glucagon, and will require IV dextrose.
    3. As soon as patient is alert enough to swallow, follow up with a meal, orange juice, D50, etc.

HALOPERIDOL (HALDOL)

Pharmacology and Actions
    The precise mechanism of action has not been clearly established. A butyrophenone that probably exerts its antipsychotic effects by blocking postsynaptic dopamine receptors in the brain.

Indications
    1. Management of psychotic disorders.

Contraindications
    1. Known hypersensitivity to medication.
    2. Coma or CNS depression.

Side Effects and Special Notes
    1. Extrapyramidal reactions
    2. Tardive dyskinesia
    3. Sedation
    4. Tachycardia
    5. Hypotension
    6. Dry mouth
HEPARIN

Pharmacology and Actions
Prevent conversion of fibrinogen to fibrin and prothrombin to thrombin by enhancing the inhibitory effects of antithrombin III.

Indications
1. Deep vein thrombosis
2. Pulmonary emboli
3. Myocardial infarction
4. Open heart surgery
5. Disseminated intravascular clotting syndrome (DIC)
6. Atrial fibrillation with embolization
7. Prevention of DVT/P.E.

Contraindications
1. Hypersensitivity
2. Hemophilia
3. Leukemia with bleeding
4. Peptic ulcer disease
5. Severe hepatic disease
6. Severe HTN

Side Effects and Special Notes
1. Monitor for bleeding gums, petechiae, ecchymosis, black tarry stools, hematuria, epistaxis and decrease in blood pressure. The antidote for heparin overdose is Protamine.
2. Heparin may increase the action of Diazepam.
3. Digitalis, tetracyclines and antihistamines decrease the action of Heparin.
4. Oral anticoagulants, salicylates, dextran, steroids and nonsteroidal anti-inflammatories increase the action of Heparin.
HEPARIN
WEIGHT ADJUSTED PROTOCOL

The following chart gives the Heparin infusion rate in both units/hr and mL/hr with a Heparin concentration of **50 units/mL** (i.e., 25,000 units in 500 mL).

</table>
HYDROCORTISONE SODIUM SUCCINATE (SOLU-CORTEF)

Pharmacology and Actions

Is a systemic corticosteroid that inhibits multiple inflammatory processes. Solu-Cortef produces multiple glucocorticoid and mineralocorticoid effects. It has a half-life of 8-12 hours and is metabolized by the liver.

Indications

1. Adrenal insufficiency (congenital adrenal hyperplasia)
2. Corticosteroid responsive conditions

Contraindications and Precautions

1. Systemic fungal infections
2. Premature infants and neonates
3. Idiopathic thrombocytopenic purpura
4. Hyperglycemia
5. Hypersensitivity
6. Decreases immune function
7. Contains benzyl alcohol

Side Effects and Special Notes

1. Sodium retention, CHF, edema
2. Hyperglycemia
3. Hypertension
4. Hyperkalemia
5. N/V
6. Headache
7. Anaphylaxis
HYDROXOCOBALAMIN (CYANOKIT®)

Pharmacology and Actions
Hydroxocobalamin, the active ingredient in CYANOKIT®, forms a strong bond with cyanide, forming nontoxic cyanocobalamin, and another form of vitamin B12, which is then safely excreted in the urine.

Indications
1. Exposure to fire or smoke in an enclosed area indicated by the presence of soot around the mouth, nose or oropharynx.
2. Suspected Cyanide poisoning.

Contraindications and Precautions
1. Cyanokit® has proven to be incompatible with other drugs; therefore, it should not be administered simultaneously in the same line as other medications, consider initiating two IV lines.
2. Possible allergic/anaphylactic reaction.
3. Substantial increases in blood pressure may occur following Cyanokit therapy.

IPRATROPIUM BROMIDE (ATROVENT)

Pharmacology and Actions
Anticholinergic bronchodilator

Indications
1. Relief of acute bronchospasm (reversible airway obstruction).

Contraindications and Precautions
1. Allergy or known hypersensitivity to Atrovent.
2. Hypersensitivity to Atropine (chemically related).
3. Those with a history of hypersensitivity to soya lecithin or related food products, such as soy beans and peanuts.
4. Use with caution in patients with heart disease, hypertension, glaucoma and the elderly.
5. Ipratropium may worsen the condition of glaucoma if it gets into the eyes. Having the patient close their eyes during nebulization may prevent this.

Side Effects and Special Notes
1. More common: cough, dry mouth or unpleasant taste.
2. Less common or rare: vision changes, eye burning or pain, dizziness, headache, nausea, nervousness, palpitations, sweating, trembling, increased wheezing or dyspnea, chest tightness, rash, hives or facial swelling.
KETAMINE

Pharmacology and Actions
Dissociative Anesthetic Agent. It has amnestic and sedative effects, but it also provides analgesia. It has a rapid onset of 45-60 seconds when give IV. Its duration of action is 5-10 minutes IV, or 12-25 minutes IM. Ketamine preserves respiratory drive and is unlikely to cause hypotension. The patient may exhibit behavior consistent with an awake state (eyes open, responds to pain) after receiving Ketamine, but is dissociated from the noxious event, making Ketamine a suitable choice for short-term sedation and analgesia.

Indications
1. Short-term management of pain and anxiety related to noxious events such as pain related injury, immobilization, movement of patient, or manipulation of injured extremities.
2. Indicated for sedation, behavioral emergencies, and medication assisted intubation.

Side Effects and Special Notes
1. Patients may have a re-emergence reaction when recovering from Ketamine that manifests as hallucinations or dreams that may be unpleasant. In general, this is reduced by concomitant use of benzodiazepines.
2. May cause hypersecretions.
3. Avoid rapid administration of Ketamine IV, which can cause HTN or respiratory depression.

LIDOCAINE (XYLOCAINE)

Pharmacology and Actions
Lidocaine attenuates phase four diastolic depolarization and decreases automaticity. It raises the ventricular fibrillation threshold.

Indications
1. Acute management of ventricular arrhythmias.
2. Prophylactic use in the acute myocardial infarction remains a subject of debate.
3. Prevents the increased intracranial pressure associated with rapid sequence intubation.

Contraindications and Precautions
1. Use with caution in patients with severe heart block (may block the only pacemaker present).

Side Effects and Special Notes
1. Overdose of Lidocaine usually results in signs of central nervous system or cardiovascular toxicity. Airway maintenance should be ensured in the event of seizures or signs of respiratory depression. Seizures may be treated with benzodiazepines. Should circulatory depression occur, vasopressors may be used. Clinical signs of CNS toxicity may include light-headedness, nervousness, apprehension, euphoria, confusion, dizziness, drowsiness, tinnitus, blurred or double vision, vomiting, sensations of heat, cold or numbness, twitching, tremors, convulsions, unconsciousness, respiratory depression and arrest.
2. Cardiovascular reactions are usually depressant in nature and are characterized by bradycardia, hypotension and cardiovascular collapse.
LEVOPHED

Pharmacology and Actions
For blood pressure control in certain acute hypotensive situations.
As an adjunct in the treatment of cardiac arrest and profound hypotension.
Stimulates alpha and beta-1 adrenergic receptors; produces inotropic and vasopressor effects.

Indications
1. Hypotension absent hypovolemia
2. Sepsis (shock)
3. Cardiogenic shock
4. Distributive shock

Contraindications and Precautions
1. Volume depletion
2. Vascular thrombosis
3. Profound Hypoxia
4. Hypercarbia
5. Hypersensitivity

Side Effects and Special Notes
HTN, arrhythmias, bradycardia, ischemic injury, asthma exacerbation, anaphylaxis and extravasation necrosis.
Category C. Use with caution if benefits outweigh risks. Animal studies show risk in pregnancy.
Not recommended in children.

1. Cardiovascular reactions are usually depressant in nature and are characterized by bradycardia, hypotension and cardiovascular collapse.
LIDOCAINE JELLY

Pharmacology and Actions
- Elicits local anesthesia.
- Stabilizes the neuronal membrane by inhibiting the ionic fluxes required for the initiation and conduction of impulses.

Indications
- 1. Anesthetic lubricant for intubation

Contraindications and Precautions
- 1. Hypersensitivity

Side Effects and Special Notes
- 1. Cardiovascular (with excessive systemic absorption)
- 2. CV depressant
- 3. Bradycardia
- 4. Hypotension
- 5. Cardiovascular collapse

MAGNESIUM SULFATE

Pharmacology and Actions
- Magnesium Sulfate acts as a smooth muscle relaxant, especially for uterine smooth muscle and a mild bronchodilator. Also acts as an antiarrhythmic agent, which may be effective in decreasing arrhythmias related to acute myocardial infarction. Acts as a central nervous system depressant and may cause respiratory depression or apnea.

Indications
- 1. Pregnancy induced hypertensive disorders (preeclampsia or eclampsia) to prevent convolutions. May transiently lower blood pressure at therapeutic levels. Can also be used as a tocolytic in pre-term labor.
- 2. May be used in irretractable ventricular tachycardia/fibrillation, especially in Torsade’s de Pointes.
- 3. Ventricular arrhythmias associated with digitalis toxicity.
- 4. Respiratory distress secondary to asthma refractory to other medications.

Contraindications and Precautions
- 1. Use cautiously in patients with renal failure.

Special Notes and Side Effects
- 1. Monitor respiratory rate every 5 minutes. For respiratory depression, discontinue Magnesium infusion and maintain airway/ventilation as needed.
- 2. Monitor blood pressure every 15 minutes.
- 3. Monitor reflexes every 30 minutes. If absent or hyper-reactive, after standard regimen, call physician.
- 4. 1-2 grams of Calcium Gluconate or Calcium Chloride is the physiologic antidote for Magnesium Sulfate toxicity.
METHYLPREDNISOLONE (SOLU MEDROL)

Pharmacology and Actions
Methylprednisolone is a synthetic steroid with potent anti-inflammatory properties. It is related to the natural hormones secreted in the adrenal cortex.

Indications
1. Severe allergic reactions, impending respiratory failure associated with asthmatic attacks and bronchospasm associated with COPD that do not respond to other treatments.

Contraindications and Precautions
1. Contraindicated in known hypersensitivity.
2. Should be used with caution in pregnant patients and patients with GI bleeding. It should also be used with caution in patients with diabetes mellitus, as hypoglycemic responses to insulin and oral hypoglycemic agents may be blunted. Hold steroids for suspected pneumonia, CHF or “metabolic hyperventilation” (DKA, sepsis, etc.).
3. A single dose is all that should be given in the prehospital setting. Long-term steroid therapy can cause gastrointestinal bleeding, prolonged wound healing, and suppression of adrenocortical steroids.

Side Effects and Special Notes
1. Fluid retention
2. Congestive heart failure
3. Hypertension
4. Abdominal distention
5. Vertigo
6. Headache
7. Nausea
8. Malaise
9. Hiccups

Potassium-depleting agents may potentiate hypokalemia induced by corticosteroids.

The pharmacological effects of steroids are vast and complex. Effective as anti-inflammatory agents, they are used in the management of allergic reactions, asthma, and anaphylaxis. Methylprednisolone is considered an intermediate-acting steroid with a plasma half-life of 3 to 4 hours.
METOPROLOL

Pharmacology and Actions
Selectively antagonizes beta 1-adrenergic receptors. Half-life is 3-7 hours.

Indications
1. AMI

Contraindications and Precautions
1. Hypersensitivity to drug/class/component
2. Sinus bradycardia
3. HR < 45 bpm (MI, acute)
4. AV block, 2nd or 3rd degree
5. AV block, PR interval > 0.24 sec (MI, acute)
6. Heart failure, uncompensated
7. Heart failure, mod-severe (MI, acute)
8. SBP < 100 mmHg (MI, acute)
9. Cardiogenic shock
10. Sick sinus syndrome w/o pacemaker

Side Effects and Special Notes
1. CHF
2. Heart block
3. Bradycardia, severe
4. Raynaud’s phenomenon
5. Bronchospasm
6. Hypersensitivity reaction
7. Hepatitis (rare)

MIDAZOLAM (VERSED)

Pharmacology and Actions
Versed is a short acting benzodiazepine with CNS depressant and anti-seizure actions.

Indications
1. Agent for short periods of sedation and to reduce agitation
2. Seizures

Contraindications and Precautions
1. Use with caution in patients with respiratory compromise/distress or decreased mental status.
2. Should not be used on patients with known hypersensitivity to benzodiazepine or narrow angle glaucoma.

Side Effects and Special Notes
1. Constant monitoring of cardiopulmonary status of patient required.
2. For short term sedation and not the drug of choice when long term sedation is required.
MORPHINE SULFATE

Pharmacology and Actions
Acts as a narcotic analgesic and produces central nervous system depression. It also manifests mild hemodynamic effects. It increases venous capacitance and systemic vascular resistance, relieving pulmonary congestion.

Indications
1. Relief of severe acute and severe chronic pain.
2. May be used for ischemic pain in ACS unrelieved by nitrates.
3. Acute cardiogenic pulmonary edema.

Contraindications and Precautions
1. Use caution in the patient with RV infarction.

Side Effects and Special Notes
1. The most common side effects are respiratory depression and orthostatic hypotension (which can be corrected with IV fluids).
2. Monitor for respiratory depressions, continuous pulse oximetry may aid in assessing respiratory depression.
3. Naloxone should be readily available for administration in the event of severe respiratory depression.

NALOXONE (NARCAN)

Pharmacology and Actions
Displaces previously administered opioid narcotic analgesics from their receptors (competitive antagonism).

Indications
1. Known or suspected opioid induced respiratory depression.

Contraindications and Precautions
1. May cause withdrawal symptoms in addicted individuals.

Side Effects and Special Notes
1. Administer slowly in an amount sufficient to reverse respiratory depression only. Given rapidly, a patient may awaken suddenly and become extremely combative.
2. The duration of the narcotic may exceed that of Naloxone. Re-administration may be necessary.
NITROGLYCERINE (NITROSTAT, TRIDIL)

Pharmacology and Actions
Relaxation of vascular smooth muscle is the principal action of Nitroglycerin. Nitroglycerin produces, in a dose related manner, dilation of both the arterial and venous beds. Venous dilation promotes peripheral pooling of blood and decreases venous return to the heart, reducing left ventricular end-diastolic pressure (preload). Arteriolar relaxation reduces systemic vascular resistance and arterial pressure (afterload). Myocardial oxygen consumption is decreased. Elevated central nervous and pulmonary capillary wedge pressures, pulmonary vascular resistance and systemic vascular resistance are also reduced.

Indications
1. Myocardial ischemia
2. Malignant hypertension
3. Congestive heart failure

Contraindications and Precautions
1. Contraindicated in patients with known hypersensitivity, hypotension, uncorrected hypovolemia, increased intracranial pressure, inadequate cerebral circulation, and pericardial tamponade.
2. Contraindicated with phosphodiesterase inhibitors (tadalafil within 48 hours and sildenafil/vardenafil within 24 hours).
4. Maintain systolic and limit blood pressure drop to 30% of pre-treatment blood pressure.

Side Effects and Special Notes
1. Headache is the most frequent adverse reaction.
2. If severe hypotension and reflex tachycardia occurs, decrease Nitroglycerin or temporarily discontinue it and place the patient in a supine position with legs elevated.
3. Sublingual Nitroglycerin can be beneficial in the clinical diagnosis of cardiac disease. Sublingual Nitroglycerin is the initial drug of choice in the patient with classic cardiac pain.
4. Intravenous Nitroglycerin should be administered by an infusion pump.
5. Blood pressure should be taken and recorded every five minutes while titrating Nitroglycerin, then every 15 minutes while infusion continues. Monitor ECG continuously.

**NITROUS OXIDE**

**Pharmacology and Actions**
A selective antagonist of a specific type of serotonin receptor located in the CNS at the area postrema (chemoreceptor trigger zone) and in the peripheral nervous system on nerve terminals of the vagus nerve. The drug’s blocking action may occur at both sites.

**Indications**
1. Broad, first-line for rapid pain relief.

**Contraindications and Precautions**
1. Head injury with altered level of consciousness
2. Recent ingestion of alcohol or illicit drugs
3. Major facial injuries or trauma
4. Thoracic trauma
5. Known or suspected bowel obstruction
6. Known or suspected cardiac ischemic chest pain
7. Patient developing cyanosis or respiratory distress with use of Nitrous Oxide – oxygen
8. Inability to comply with instructions regarding use of Nitrous Oxide – oxygen
9. Pulse oximeter ready indicating oxygen saturation less than 90% prior to Nitrous Oxide – Oxygen mixture use

**Side Effects and Special notes**
1. Euphoria
2. Disassociation

**ONDANSETRON (ZOFRAN)**

**Pharmacology and Actions**
A selective antagonist of a specific type of serotonin receptor located in the CNS at the area postrema (chemoreceptor trigger zone) and in the peripheral nervous system on nerve terminals of the vagus nerve. The drug’s blocking action may occur at both sites.

**Indications**
1. Prevention of nausea and vomiting.

**Contraindications and Precautions**
1. Known hypersensitivity to the medication.

**Side Effects and Special Notes**
1. Use cautiously in patients with liver failure.
OXYMETHAZOLINE HYDROCHLORIDE (AFRIN)

Pharmacology and Actions
Thought to cause local vasoconstriction of dilated arterioles, reducing blood flow and nasal congestion.

Indications
1. Nasal congestion, prior to nasal intubation to lessen the chance of causing and epistaxis.

Contraindications and Precautions
1. Known hypersensitivity to the drug.
2. Use cautiously in patient with hyperthyroidism, cardiac disease, hypertension or diabetes mellitus.

Side Effects and Special Notes
1. Bottle is single patient use only and needs to be replaced after each use.

OXYTOCIN (PITOCIN)

Pharmacology and Actions
Selectively stimulates the smooth musculature of the uterus resulting in increased uterine muscle tone, increased frequency of contractions and increased strength of contractions.

Indications
1. In hospital - normal postpartum – to produce uterine contractions.
2. Postpartum hemorrhage – to control excessive uterine bleeding when related to recent childbirth.

Contraindications and Precautions
1. Known hypersensitivity to the drug and with retained placenta.

Side Effects and Special Notes
1. Side effects include: Cardiac dysrhythmia, pelvic hematoma, hypertonicity of the uterus, uterine rupture, nausea, vomiting and fluid retention.
2. Monitor vaginal drainage and uterine tonicity during administration.
PROMETHAZINE (PHENERGAN)

Pharmacology and Actions
Promethazine is a phenothiazine and acts as an antiemetic.

Indications
1. Prophylaxis and treatment of nausea and vomiting.

Contraindications and Precautions
1. Contraindicated in patients with central nervous system depression.

Side Effects and Special Notes
1. Most common adverse effects are sedation, drowsiness and dry mouth.
2. May cause dystonia and extrapyramidal reactions. Treat both with 25-50 mg Diphenhydramine IV.

POTASSIUM CHLORIDE

Pharmacology and Actions
Potassium is a mineral that the human body requires for proper functioning of neuromuscular tissues.

Indications
1. Used for the treatment of hypokalemia.

Contraindications and Precautions
1. Severe renal impairment with oliguria and anuria.
2. Hyperkalemia

Side Effects and Special Notes
1. Adverse reactions to Potassium Chloride administration include peripheral vascular collapse with hypotension, cardiac arrhythmias, heart block, possible cardiac arrest, EKG changes (prolonged P-R interval, wide QRS, ST segment depression, tall tinted T waves), nausea, vomiting, abdominal pain and pain at the infusion site.
2. Potassium Chloride should be administered via an infusion pump.
3. 1-3cc of 1% Lidocaine may be added directly to the Potassium Chloride solution to decrease pain at the infusion site.
4. Patients receiving Potassium Chloride at rates greater than 20 mEq per hour should have continuous ECG monitoring.
5. Treat hyperkalemia: 1 gm Calcium Chloride + 5 units regular insulin + 50 gm Glucose
RACEMIC EPINEPHRINE (VAPONEPHRIN)

Pharmacology and Actions
Effects are those of Epinephrine. Inhalation causes local effects on the upper airway as well as systemic effects from absorption. Vasoconstriction may reduce swelling in the upper airway and beta effects on bronchial muscle may relieve bronchospasm.

Indications

Contraindications and Precautions
1. Use with caution in patients with cardiovascular disorders including coronary insufficiency and hypertension.

Side Effects and Special Notes
1. Adverse effects of Racemic Epinephrine include tremor, nervousness, tachycardia, palpitations and occasionally hypertension. Since these are also symptoms of hypoxia, be sure to monitor the patient closely.
2. Racemic Epinephrine is heat and light sensitive. If the solution is discolored, it should be discarded.
3. Clinical improvement in croup can be dramatic after administration of Racemic Epinephrine. Rebound worsening of airway obstruction can occur, however, in one to four hours. Many patients require admission after administration.

TETRACAIN

Indications
1. Provides anesthesia prior to ophthalmic procedures, such as irrigation.

Contraindications and Precautions
1. Known hypersensitivity

Side Effects and Special Notes
1. Use cautiously in patients with cardiac disease and hyperthyroidism.
2. Not for long term use.
3. Warn patient not to rub or touch eye while it is anesthetized. This may cause corneal abrasion and greater pain when anesthesia wears off.
4. Do not use discolored solution.
SODIUM BICARBONATE

Pharmacology and Actions
Sodium Bicarbonate reacts with hydrogen ions to form water and carbon dioxide to buffer metabolic acidosis.

Indications
1. Acidosis that accompanies shock and cardiac arrest.
2. Treatment of tricyclic antidepressant overdose.
3. Preexisting or life threatening hyperkalemia.
4. Crush injuries to prevent Rhabdomyolysis.

Side Effects and Special Notes
1. Sodium Bicarbonate can inactivate the catecholamines norepinephrine, dopamine and epinephrine. Do not mix with IV solutions of these agents.

THIAMINE (VITAMIN B1)

Pharmacology and Actions
Combines with Adenosine Triphosphate to form a coenzyme necessary for carbohydrate metabolism.

Indications
1. Administered concurrently with D50 in intoxicated or malnourished patients to prevent Wernicke’s encephalopathy.

Contraindications and Precautions
1. Known hypersensitivity to the drug.

Side Effects and Special Notes
1. IV use: dilute before giving. Administer cautiously - give patient a skin test before therapy if he has a history of hypersensitivity reactions.
2. Thiamine malabsorption is most likely in alcoholism, cirrhosis or GI disease.

TRANEXAMIC ACID

Pharmacology and Actions
Tranexamic acid is a synthetic analog of the amino acid lysine. It serves as an antifibrinolytic by reversibly binding four to five lysine receptor sites on plasminogen. This reduces the conversion of plasminogen to plasmin, preventing fibrin degradation and preserving the framework of fibrin’s matrix structure.

Indications
1. Suspected or impending hemorrhagic shock with time of onset < 3 hours.

Contraindications and Precautions
1. Known hypersensitivity
2. No other contraindications in the acutely hemorrhaging patient
3. Rapid administration may cause hypotension

Appendix C:

Operational
Radiation initial victim care:

Do not survey victims with serious injury on-scene, control clothing or cocoon and EMS transport per usual trauma protocols.

---

**Radiological Response Aid**

<table>
<thead>
<tr>
<th>Zone</th>
<th>Dose Rate (mR=milli rad, R=rad)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safe</td>
<td>Less than 1 mR/hour</td>
</tr>
<tr>
<td>Rescue Perimeter</td>
<td>Less than 10 mR/hour</td>
</tr>
<tr>
<td>Rescue Zone</td>
<td>10–10,000 mR/hour (0.01–10R/hour)</td>
</tr>
</tbody>
</table>

**Maximum Exposure/Turn Back Rate**

<table>
<thead>
<tr>
<th>Dose Rate</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 R</td>
<td>General operations total dose</td>
</tr>
<tr>
<td></td>
<td>Greater than 10 R/h (30 min of non-lifesaving activities)</td>
</tr>
<tr>
<td>25 R</td>
<td>Lifesaving total dose</td>
</tr>
<tr>
<td></td>
<td>Greater than 100 R/h (15 min of lifesaving activities)</td>
</tr>
</tbody>
</table>

---

**Beta / Gamma:**

<table>
<thead>
<tr>
<th>CPM Range</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 10,000 cpm</td>
<td>Home with decon card</td>
</tr>
<tr>
<td>10,000 – 25,000 cpm</td>
<td>Dry decon kit / clothing control</td>
</tr>
<tr>
<td>Greater than 25,000 cpm</td>
<td>Consider wet decon if weather permits, otherwise dry, re-survey after decon</td>
</tr>
<tr>
<td>Greater than 100,000 cpm</td>
<td>Refer to medical facility</td>
</tr>
</tbody>
</table>

* cpm = counts per minute

**Write cpm on patient’s arm in permanent marker**

---

**Alpha emitter – NO portal monitors – check facial areas with alpha-capable survey meter and note on victim card / arm where contamination present**

---

**Patient**

<table>
<thead>
<tr>
<th>Patient Status</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Refer to hospital after clothing removal. May consider initial wet wound decon at scene based on resources</td>
</tr>
<tr>
<td>Yellow / Red</td>
<td>Usual triage / treatment / transport priorities – do NOT survey on scene – hospitals will screen after stabilized – control clothing or cocoon</td>
</tr>
</tbody>
</table>
